MAX3421 Evaluation Kit-1

General Description

The MAX3421 evaluation kit-1 (EV kit-1) provides a proven design to evaluate the MAX3421E USB peripheral controller with SPI™ interface. The EV kit contains both a MAX3421E USB host & peripheral controller and a MAX3420E USB peripheral controller for user evaluation and development. Connector J4 is wired to plug into a Keil MCB2130 development board that contains a Philips ARM controller (LPC2318). The design uses two separate SPI ports to provide independent operation of the two USB controllers (MAX3421E and MAX3420E).

The MAX3421 EV kit-1 adds USB functionality to any microcontroller, microprocessor, DSP, CPLD, FPGA, or ASIC with an SPI master interface, or five GPIO lines.

The EV kit-1 board comes with the MAX3421EEHJ+ and MAX3420EECJ+ installed.

Features

- ◆ Ideal USB Training and Debugging System
- ◆ Mates to Keil MCB2130 Development Board
- ◆ Can Be Wired into User Systems
- ◆ MAX3421E Can Be Used as a USB Host or Peripheral
- ◆ MAX3420E Provided On-Board as a Test Peripheral
- ◆ MAX3420E Can be Used to Develop USB Peripheral Code

Ordering Information

PART NUMBER	TYPE	PC INTERFACE

MAX3421 Evaluation Kit-1

Figure 1. Block Diagram

Detailed Description of Hardware

The MAX3421 EV kit-1 has three USB connectors (Figure 1). The MAX3421E is wired to USB connectors J1 and J2. Plug a cable into USB Type A connector J1 when using the MAX3421E as a host. Plug a cable into USB Type B connector J2 when using the MAX3421E as a peripheral. **Do not use J1 and J2 at the same time.** Connectors J1 and J2 have their D+ and D- pins wired together, and are intended to be connected only one at a time. USB peripheral controller MAX3420E is wired to USB Type B connector J5.

When the MAX3421E (U1) operates as a host, the EV kit must supply VBUS power to USB Type A connector J1. This power must in turn be supplied to the EV kit through power connector J3, which is located in the middle of the board. When mated with a board such as the Keil MCB2130, a "flying lead" can be attached between J3 and the Keil board's 5V IN test pad. Alternatively, a standard 5VDC lab supply can be used. The MAX4793 (U3) controls and current-limits the VBUS voltage. U1 can turn VBUS power on and off using one of its GP-OUT pins (GPOUT7), and can detect a

300mA overcurrent condition on GP-IN pin, (GPIN0). Refer to the MAX4793 data sheet for more information.

Buttons and lights are connected to both the MAX3420E and MAX3421E controllers. U1 drives a 7-segment readout and connects to four pushbuttons (PB1–PB4). U2 drives four LEDs and connects to push-buttons PB5–PB8.

The MAX3420E and MAX3421E connect to two separate SPI ports (see Table 1). This allows host and peripheral applications to run concurrently in the same code, when implemented on a dual-SPI microcontroller (such as the ARM LPC2318 used on the Keil MCB2130 board). This provides an ideal USB training and debugging system. The host can dispatch USB requests to the peripheral, the peripheral can respond, and the host can evaluate the results—all in the same C code.

Stand-Alone Operation

Although the MAX3421 EV kit-1 is designed to plug into a Keil MCB2130 board, it also functions as a stand-alone board that can be wired into any customer system with an SPI interface. Table 1 shows the J4 pins that correspond to the MAX3420E and MAX3421E interfaces.

User Notes:

- 1) The MAX3420E connects to USB Type B connector J5, while the MAX3421E connects both to USB Type A connector J1 and to USB Type B connector J2. The MAX3421E, therefore, can be connected as a host (J1) or a peripheral (J2).
- 2) The user system must supply 3.3V on J4 pins 1-2 to power the board. The 3.3V supply should be capable of providing 100mA.
- 3) The $\overline{RES}$ pins connect directly to the MAX3420E/MAX3421E reset pins. It must be driven high for the chip to operate.
- 4) When operating the MAX3421E as a host controller, the user system must provide 5V power on J4 pins 33-34, or on J3 pin 3. This voltage connects to the VBUS pin of USB Type A connector J1 through a current-limiting switch. The user system must supply

enough current to power any USB device plugged into J1. The current-limiting switch (a MAX4793) limits the VBUS current to 300mA.

- 5) Keep leads to the target system short (under 6in). Long leads and insufficient grounds can lead to signal ringing and erratic operation.
- 6) When using the MAX3421E as a host, the user program must set the MAX3421E GPO7 pin high to turn on the VBUS switch (U3) that supplies 5V to the USB Type A connector J1. Note that the MAX3421E output port also drives the 7-segment readout using GPO[6:0]. Therefore, the code that updates the 7-segment readout must preserve the bit 7 setting, and the code that turns VBUS on and off must preserve the bits [6:0] settings. This is easily accomplished by first reading the states of the output bits, changing only the needed bits, then writing them back.
