24-BIT, 96-kHz STEREO A/D CONVERTER WITH 6 × 2-CHANNEL MUX AND PGAE

FEATURES

- **Multiplexer and Programmable-Gain Amplifier (PGA)**
 - 6×2-Channel Single-Ended Inputs
 - Multiplexed Output
 - Maximum Input Level: 2.4 V rms
 - Input Resistance: 50 kΩ, Minimum
 - PGA Gain: 11-dB to –11-dB Range, 0.5 dB/Step
- **24-Bit Delta-Sigma Stereo A/D Converter**
- **Antialiasing Filter Included**
- **Oversampling Decimation Filter**
 - Oversampling Frequency: ×64
 - Pass-Band Ripple: ±0.05 dB
 - Stop-Band Attenuation: –65 dB
 - On-Chip High-Pass Filter: 0.91 Hz (48 kHz)
- **High Performance**
 - THD+N: 0.0023% (Typically)
 - SNR: 101 dB (Typically)
 - Dynamic Range: 102 dB (Typically)

- **PCM Audio Interface**
 - Master/Slave Mode Selectable
 - Data Formats: 24-Bit Left-Justified, 24-Bit I²S, 16-, 24-Bit Right-Justified
- **Mode Control by Serial Interface:**
 - With SPI Control (PCM1850A)
 - With I²C Control (PCM1851A)
- **Sampling Rate: 16–96 kHz**
- **System Clock: 256 f_s, 384 f_s, 512 f_s, 768 f_s**
- **Dual Power Supplies: 5 V for Analog, 3.3 V for Digital**
- **Package: 32-Pin TQFP**

APPLICATIONS

- DVD/HDD/DVD+HDD Recorder
- AV Amplifier Receiver
- CD Recorder
- MD Recorder
- Multitrack Recorder
- Electric Musical Instrument

DESCRIPTION

The PCM1850A/1851A is a high-performance, low-cost, single-chip stereo analog-to-digital converter with a single-ended analog front end that consists of a 6-stereo-input multiplexer and wide-range PGA. The PCM1850A/1851A includes a delta-sigma modulator with 64-times oversampling, a digital decimation filter and a low-cut filter that removes the dc component of the input signal. For various applications, the PCM1850A/1851A supports two modes (master and slave) and four data formats through a serial control interface, SPI for the PCM1850A and I²C for the PCM1851A. The PCM1850A/1851A is suitable for a wide variety of cost-sensitive DVD/CD/MD recorder and receiver applications where good performance and operation from a 5-V analog supply and 3.3-V digital supply is required. The PCM1850A/1851A is fabricated using a highly advanced CMOS process and is available in a small 32-pin TQFP package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SLES173–MARCH 2006

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PCM1851A

SLES173–MARCH 2006

DETAILED DESCRIPTION

SYSTEM CLOCK

The PCM1850A/1851A supports $256 f_s$, $384 f_s$, $512 f_s$, and $768 f_s$ as the system clock, where f_s is the audio sampling frequency. The system clock must be supplied on SCKI (pin 7).

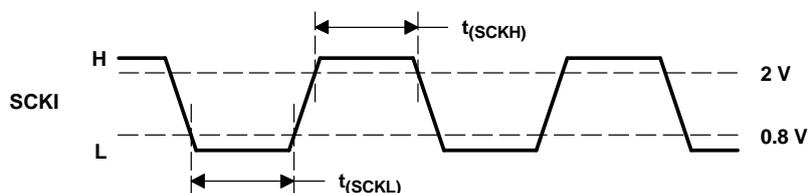

The PCM1850A/1851A has a system clock detection circuit which automatically senses if the system clock is operating at $256 f_s$, $384 f_s$, $512 f_s$, or $768 f_s$ in slave mode. In master mode, the system clock frequency must be selected by mode control via the serial port. The $768 f_s$ system clock is not available in master mode or for $f_s = 88.2$ kHz and 96 kHz in the slave mode. The system clock is divided into $128 f_s$ and $64 f_s$ automatically, and these frequencies are used to operate the digital filter and the delta-sigma modulator, respectively.

Table 1 shows the relationship of typical sampling frequency to system clock frequency, and Figure 20 shows system clock timing.

Table 1. Sampling Frequency and System Clock Frequency

SAMPLING RATE FREQUENCY (kHz)	SYSTEM CLOCK FREQUENCY (MHz)			
	$256 f_s$	$384 f_s$	$512 f_s$	$768 f_s^{(1)}$
32	8.192	12.288	16.384	24.576
44.1	11.2896	16.9344	22.5792	33.8688
48	12.288	18.432	24.576	36.864
64	16.384	24.576	32.768	49.152
88.2	22.5792	33.8688	45.1584	—
96	24.576	36.864	49.152	—

SYMBOL	PARAMETER	MIN	MAX	UNIT
$t_{(SCKH)}$	System clock pulse duration, HIGH	8		ns
$t_{(SCKL)}$	System clock pulse duration, LOW	8		ns

Figure 20. System Clock Timing

POWER-ON-RESET SEQUENCE

The PCM1850A/1851A has an internal power-on-reset circuit, and initialization (reset) is performed automatically at the time that the power supply (V_{DD}) exceeds 2.2 V (typical). While $V_{DD} < 2.2$ V (typical) and for 1024 system clocks after $V_{DD} > 2.2$ V (typical), the PCM1850A/1851A stays in the reset state and the digital output is forced to zero. The digital output is valid after the reset state is released and the time of $4500/f_S$ has passed. At the moment of the power-on-reset release, the PCM1850A/1851A does not need a system clock. [Figure 21](#) illustrates the internal power-on-reset timing and the digital output for power-on reset.

SLES173-MARCH 2006

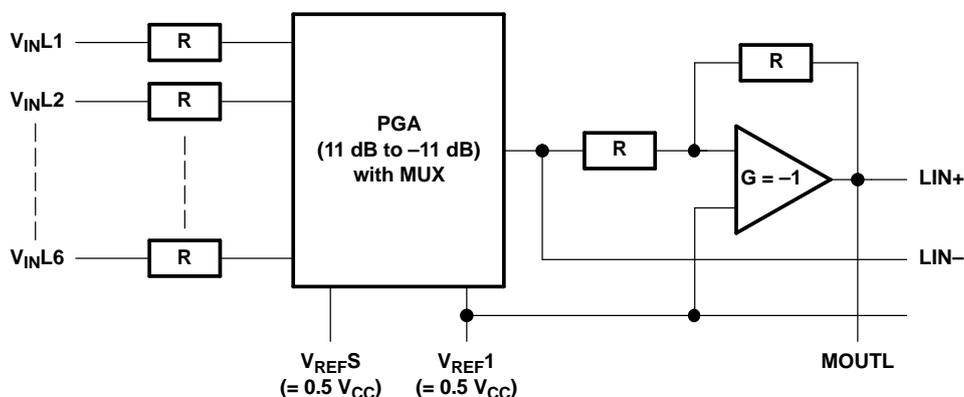

ANALOG FRONT END

The PCM1850A/1851A has a built-in analog front-end circuit, which is shown in the block diagram of Figure 22. Selection of the multiplexer input and PGA gain is controlled by mode control via the serial port as shown in Table 2 and Table 3. The change of the input selection and the gain selection is performed immediately after the serial control packet for the change is sent. A popping noise or other unexpected transient response could be generated in the audio signal during channel and gain change. Because the PCM1850A/1851A has no zero-cross detection and no other buffering capability for channel and gain change, appropriate data handling in the digital domain is recommended to control transients.

The PCM1850A/1851A analog front end permits only ac input via an input capacitor; dc input is prohibited. A signal source resistance of less than 1 kΩ is recommended for the V_{IN}xx pins.

All unselected channel inputs are terminated V_{REFS} (= 0.5 V_{CC}) using a resistor, typically 57 kΩ.

The PCM1850A/1851A employs MOUTL/R pins (pins 12 and 11) to monitor the multiplexer output. The load on these pins must be ac-coupled and not less than 10 kΩ. The full-scale output level is typically 0.6 V_{CC}.

SLES173–MARCH 2006

SERIAL AUDIO DATA INTERFACE

The PCM1850A/1851A interfaces with the audio system through BCK (pin 2), LRCK (pin 1), and DOUT (pin 3).

Interface Mode

The PCM1850A/1851A supports both master and slave modes as interface modes, and they are selected by mode control via the serial port as shown in [Table 4](#).

In master mode, the PCM1850A/1851A provides the timing for serial audio data communications between the PCM1850A/1851A and the digital audio processor or external circuit. While in slave mode, the PCM1850A/1851A receives the timing for data transfer from an external controller.

Table 4. Interface Mode

MD1	MD0	INTERFACE MODE
0	0	Slave mode (256 f _S , 384 f _S , 512 f _S , 768 f _S) (default)
0	1	Master mode (256 f _S)
1	0	Master mode (384 f _S)
1	1	Master mode (512 f _S)

Master Mode

In master mode, BCK and LRCK work as output pins, and these pins are controlled by timing which is generated in the clock and timing control circuit of the PCM1850A/1851A. The frequency of BCK is fixed at 64 × LRCK. A 768-f_S system clock is not available in master mode.

Slave Mode

In slave mode, BCK and LRCK work as input pins. The PCM1850A/1851A accepts the 64 BCK/LRCK or 48 BCK/LRCK (only for 384 f_S SCKI) format. A 768-f_S system clock is not available for f_S = 88.2 kHz and 96 kHz in slave mode.

Data Format

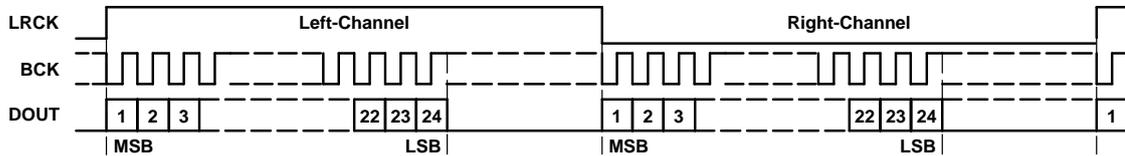

The PCM1850A/1851A supports four audio data formats in both master and slave modes, and they are selected by mode control via the serial port as shown in [Table 5](#). [Figure 23](#) illustrates the data formats in both slave and master modes.

Table 5. Data Format

FORMAT NO.	FMT2	FMT1	FMT0	FORMAT
0	1	0	1	Left-justified, 24-bit
1	1	0	0	I ² S, 24-bit, (default)

**PCM1850A
PCM1851A**

SLES173-MARCH 2006

SYNCHRONIZATION WITH DIGITAL AUDIO SYSTEM

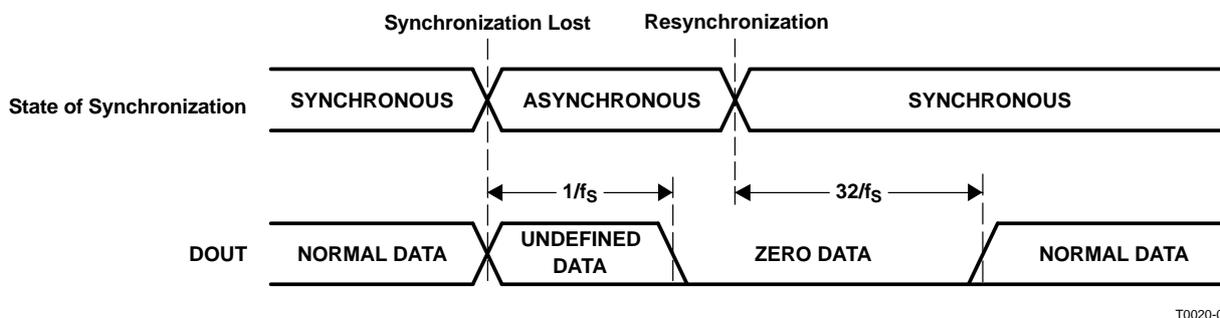

In slave mode, the PCM1850A/1851A operates under LRCK, synchronized with system clock SCKI. The PCM1850A/1851A does not need a specific phase relationship between LRCK and SCKI, but does require the synchronization of LRCK and SCKI.

If the relationship between LRCK and SCKI changes more than ± 6 BCKs for 64 BCKs/frame (± 5 BCKs for 48 BCKs/frame) during one sample period due to LRCK or SCKI jitter, internal operation of the ADC halts within $1/f_s$ and digital output is forced into the BPZ code until resynchronization between LRCK and SCKI is completed.

In the case of changes less than ± 5 BCKs for 64 BCKs/frame (± 4 BCKs for 48 BCKs/frame), resynchronization with simultaneous discontinuity in the digital output does not occur.

Figure 26 illustrates the digital output response for loss of synchronization and resynchronization. During undefined data, the PCM1850A/1851A might generate some noise in the audio signal. Also, the transition of normal to undefined data and undefined or zero data to normal creates a discontinuity of data in the digital output, which could generate some noise in the audio signal.

It is recommended to set \overline{RST} (pin 10) to LOW to get stable analog performance when the sampling rate, interface mode, or data format is changed.

T0020-05

Figure 26. ADC Digital Output for Loss of Synchronization and Resynchronization

Power-Down Control

\overline{RST} (pin 10) controls the entire ADC operation. During reset mode, the supply current of the analog section is shut off and the digital section is initialized. DOUT (pin 3) is also disabled. Halting SCKI, BCK, and LRCK is recommended to minimize power dissipation.

RST	POWER-DOWN MODE
LOW	Reset and power-down modes
HIGH	Normal operation mode

Overflow Flag Output

The PCM1850A/1851A has an output flag (pin 4) that indicates when overflow occurs in the L-channel or R-channel, and this flag remains HIGH at least during the $8192/f_s$ time for a momentary overflow occurrence.

HPF Bypass Control

The built-in HPF function for dc component rejection can be bypassed via the serial port. In bypass mode, the dc component of the analog input signal, the internal dc offset, etc., are converted and included in the digital output data.

BYP	HPF (HIGH-PASS FILTER) MODE
0	Normal (no dc component on DOUT) mode (default)
1	Bypass (dc component on DOUT) mode

System Reset Control

The system reset control is used to resynchronize the system via the serial port when the system clock frequency, interface mode, and data format are changed. Change them while SRST = LOW. If they are changed during normal operation, analog performance can be degraded.

SRST	SYSTEM RESET
0	Resynchronization
1	Normal operation (default)

Mode Register Reset Control

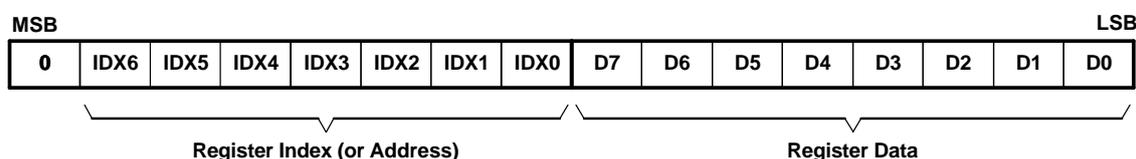

The MRST bit is used to reset the mode control register to its default settings via the serial port.

MRST	MODE REGISTER RESET
0	Set default value
1	Normal operation (default)

SPI SERIAL CONTROL PORT FOR MODE CONTROL (PCM1850A)

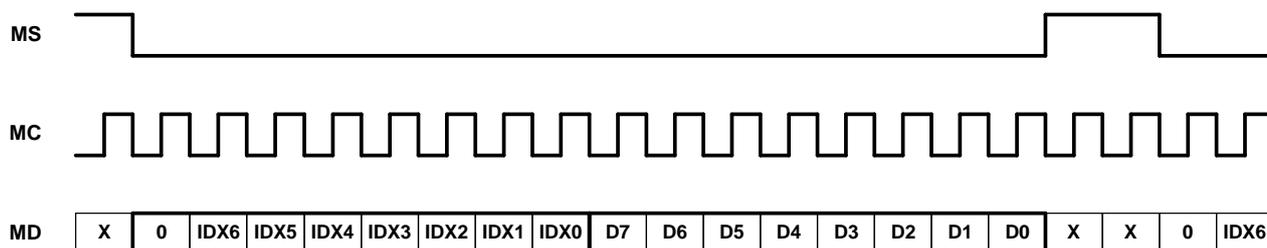

The user-programmable built-in functions of the PCM1850A can be controlled through a serial control port with the SPI format. All operations for the serial control port use 16-bit data words. Figure 27 shows the control data word format. The most-significant bit must be set to 0. Seven bits, labeled IDX[6:0], set the register index (or address) for write operations. The least-significant eight bits, D[7:0], contain the data to be written to the register specified by IDX[6:0].

Figure 28 shows the functional timing diagram for writing to the serial control port. MS (pin 30) is held at a logic-1 state until a register needs to be written. To start the register write cycle, MS is set to logic-0. Sixteen clocks are then provided on MC (pin 31), corresponding to the 16 bits of the control data word on MD (pin 32). After the sixteenth clock cycle has completed, the data is latched into the indexed mode control register in the write operation. To write the next data word, MS must be set to 1 once.

Figure 29. PCM1850A Control Interface Timing

I²C SERIAL CONTROL PORT FOR MODE CONTROL (PCM1851A)

The user-programmable built-in function of the PCM1851A can be controlled through the I²C-format serial control port, SDA (pin 32) and SCL (pin 31). The PCM1851A supports the I²C serial bus and the data transmission protocol for standard mode as a slave device. This protocol is explained in I²C specification 2.0.

Slave Address

MSB						LSB	
1	0	0	1	0	1	ADR	R/nW

The PCM1851A has 7 bits for its own slave address. The first six bits (MSBs) of the slave address are factory preset to 100101. The last bit of the address byte is the device select bit, which can be user-defined by the ADR pin (pin 30). A maximum of two PCM1851As can be connected on the same bus at one time. Each PCM1851A responds when it receives its own slave address.

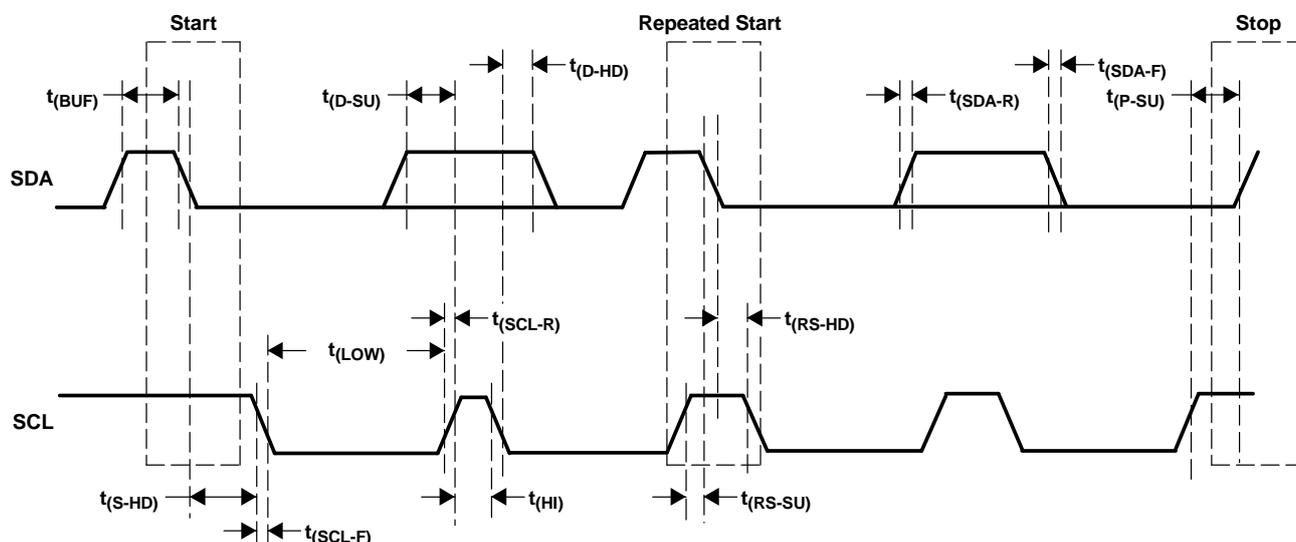

Packet Protocol

A master device must control packet protocol, which consists of start condition, slave address with read/write bit, data if write or acknowledgement if read, and stop condition. The PCM1851A supports only slave receivers, so the R/W bit must be set to 0.

MODE CONTROL REGISTERS

User-Programmable Mode Control Functions

The PCM1850A/1851A has several user-programmable functions which are accessed via control registers. The registers are programmed using the serial control port which is discussed in the *SPI Serial Control Port for Mode Control (PCM1850A)* and *I²C Serial Control Port for Mode Control (PCM1851A)* sections of this data sheet. [Table 6](#) lists the available mode control functions, along with their reset default conditions and associated register index.

Register Map

The mode control register map is shown in [Table 7](#). Each register includes an index (or address) indicated by the `IDX[6:0]` bits `B[14:8]`.

Table 6. User-Programmable Mode Control Functions

APPLICATION INFORMATION

TYPICAL CIRCUIT CONNECTION DIAGRAM

The following figure illustrates a typical circuit connection diagram for six stereo inputs and an analog monitor.

(1) PCM1850A (PCM1851A)

S0181-01

NOTE: C₁, C₂: 0.1- μ F ceramic and 10- μ F electrolytic capacitors are recommended, depending on layout and power supply.
 C₃, C₄, C₅: 0.1- μ F ceramic and 10- μ F electrolytic capacitors are recommended.
 C₆-C₁₇: A 0.33- μ F capacitor gives a 2.9-Hz ($\tau = 0.33 \mu\text{F} \times 169 \text{k}\Omega$) typical cutoff frequency at the HPF input in normal operation, and it requires power-on settling time with a 56-ms time constant in the power-on initialization period. Cutoff frequency and time constant depend on PGA gain. Cutoff frequency varies from 2.4 Hz to 8.5 Hz for 0.33 μ F.
 DC-coupled input is inhibited for the analog input, V_{INL}[1:6] and V_{INR}[1:6].
 C₁₈-C₁₉: A 2.2- μ F capacitor with a 10-k Ω load gives a 7.2-Hz cutoff frequency.

APPLICATION INFORMATION (continued)

BOARD DESIGN AND LAYOUT CONSIDERATIONS

V_{CC} , V_{DD} Pins

The digital and analog power supply lines to the PCM1850A/1851A must be bypassed to the corresponding ground pins with 0.1- μ F ceramic and 10- μ F electrolytic capacitors as close to the pins as possible to maximize the dynamic performance of the ADC.

AGND, DGND Pins

To maximize the dynamic performance of the PCM1850A/1851A, the analog and digital grounds are not connected internally. These grounds must have low impedance to avoid digital noise feeding back into the analog ground. Therefore, they should be connected directly to each other under the parts to reduce the potential of a noise problem.

$V_{INL}[1:6]$, $V_{INR}[1:6]$ Pins

A 0.33- μ F capacitor is recommended as the ac-coupling capacitor, which gives a 2.4- to 8.5-Hz cutoff frequency. If higher full-scale input voltage is required, it can be adjusted by adding only one series resistor to each V_{INxx} pin, but a signal source resistance less than 1 k Ω is recommended for these pins in order to keep accuracy of the gain control command and to maintain crosstalk performance.

MOU_{TL}, MOU_{TR} Pins

An ac-coupled light load is recommended; a 2.2- μ F capacitor with a 10-k Ω load gives a 7.2-Hz cutoff frequency.

V_{REF1} , V_{REF2} , V_{REFS} Pins

Between V_{REF1} and AGND, V_{REF2} and AGND, and V_{REFS} and AGND, 0.1- μ F ceramic and 10- μ F electrolytic capacitors are recommended to ensure low source impedance of the ADC references. These capacitors should be located as close as possible to the V_{REF1} , V_{REF2} , and V_{REFS} pins to reduce dynamic errors on the ADC references. The differential voltage between V_{REF2} and AGND sets the analog input full-scale range.

BCK and LRCK Pins (in Master Mode), DOUT Pin

These pins have enough load-driving capability. However, if the output line is long, locating a buffer near the PCM1850A/1851A and minimizing load capacitance is recommended in order to minimize the digital-analog crosstalk and maximize the dynamic performance of the ADC.

System Clock

Because the PCM1850A/1851A operates based on a system clock, the quality of the system clock can influence dynamic performance. Therefore, it is recommended to consider the system clock duty, jitter, and the time difference between the system clock transition and the BCK or LRCK transition in slave mode.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

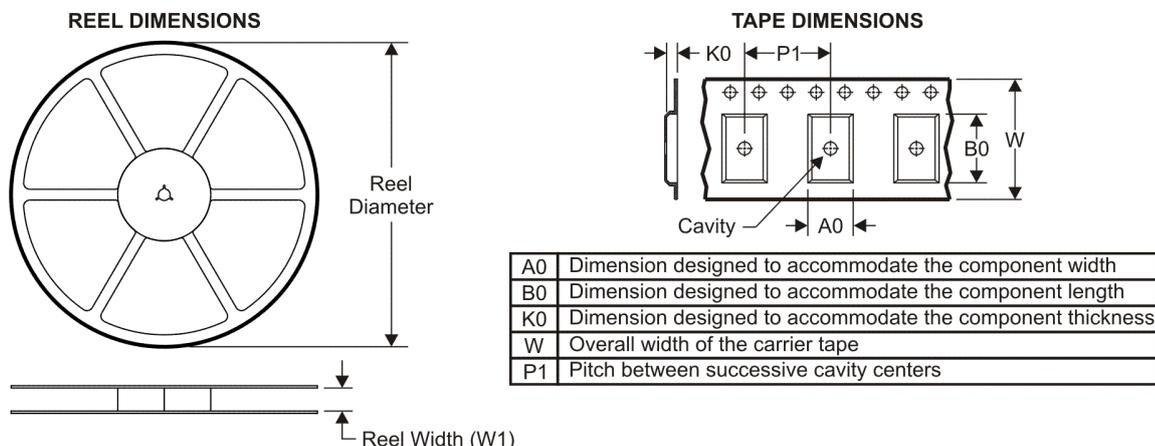

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC QUAD FLATPACK

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MS-026

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
