EVALUATION KIT
AVAILABLE

W-CDMA/W-TDD/TD-SCDMA Zero-IF Receivers

General Description

The MAX2390–MAX2393/MAX2396/MAX2400/MAX2401 (referred to as the “MAX2390 family”) fully integrated direct-conversion receiver ICs are designed for W-CDMA and TD-SCDMA applications.

The MAX2390 family of receiver ICs have over 90dB of dynamic gain control, and typical noise figure of 2.7dB referred to LNA input. Each receiver consists of an ultra-low-current low-noise amplifier (LNA) with on-chip output matching and a two-step gain control. The zero-IF demodulator has a differential circuit topology for minimum LO leakage to receiver's input. The channel selectivity is done completely in the baseband section of the receiver with an on-chip lowpass filter. The AGC section has over 50dB of gain-control range. LO quadrature generation is done on-chip through a divide-by-2 prescaler. The DC offset cancellation in the I/Q baseband channels is done fully on-chip using a DC servo loop. To quickly correct for large DC offset transients in minimal time, very fast settling time is obtained by optimization of the DC-offset-cancellation circuit's time constant.

The MAX2390 family includes a 3-wire serial bus for configuring the different receiver modes. They also include a SHDN pin for full device shutdown. The receivers are fabricated using an advanced high-frequency SiGe BiCMOS process. The ICs operate from a single +2.7V to +3.3V supply and are housed in a small 28-pin leadless QFN-EP and thin QFN-EP packages (5mm x 5mm).

Applications

IMT2000 Handsets

TD-SCDMA Handsets

UMTS Handsets

W-CDMA TDD Handsets

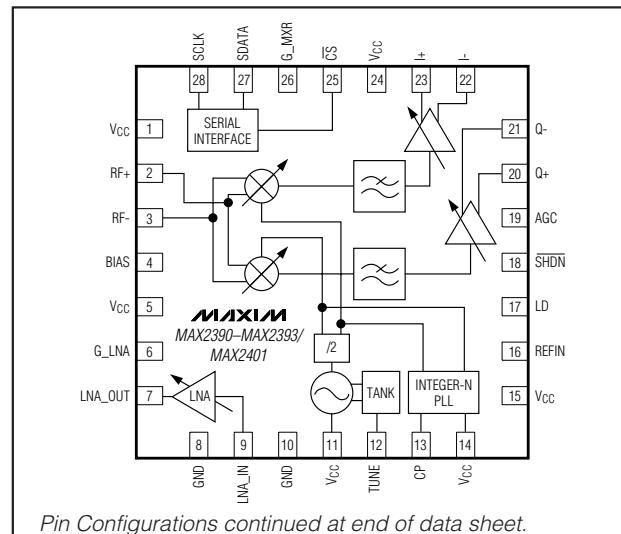

W-CDMA Band II (PCS)
Handsets

W-CDMA Band III (DCS)
Handsets

Features

- ◆ Fully Monolithic Direct-Conversion Receivers
- ◆ Eliminate External IF SAW + IF AGC + I/Q Demod
- ◆ Meet all 3GPP Receiver's Standard Requirements with at Least 3dB Margin on Eb/No
- ◆ Operate from a +2.7V to +3.3V Single Supply
- ◆ Over 90dB of RF+ Baseband Gain-Control Range
- ◆ Channel Selectivity Over 40dB
- ◆ Receiver Current Consumption \approx 32mA
- ◆ On-Chip DC Offset Cancellation
- ◆ Compatible with Various CMOS Logic Levels

Pin Configurations/ Functional Diagrams

Pin Configurations continued at end of data sheet.

Ordering Information/Selector Guide

PART	TEMP RANGE	PIN-PACKAGE	APPLICATION	CHIP RATE (Mcps)	RF BAND (MHz)	SYNTHESIZER
MAX2390ETI	-40°C to +85°C	28 Thin QFN-EP*	W-CDMA Band II	3.84	1930 to 1990	On-Chip
MAX2391ETI	-40°C to +85°C	28 Thin QFN-EP*	IMT2000/UMTS	3.84	2110 to 2170	On-Chip
MAX2391ETI+	-40°C to +85°C	28 Thin QFN-EP*	IMT2000/UMTS	3.84	2110 to 2170	On-Chip
MAX2392ETI	-40°C to +85°C	28 Thin QFN-EP*	TD-SCDMA	1.28	2010 to 2025	On-Chip
MAX2392ETI+	-40°C to +85°C	28 Thin QFN-EP*	TD-SCDMA	1.28	2010 to 2025	On-Chip
MAX2393EGI	-40°C to +85°C	28 QFN-EP*	W-TDD/TD-SCDMA	3.84 or 1.28	1900 to 1920	On-Chip
MAX2396EGI	-40°C to +85°C	28 QFN-EP*	IMT2000/UMTS	3.84	2110 to 2170	External
MAX2400ETI	-40°C to +85°C	28 Thin QFN-EP*	W-CDMA Band II	3.84	1930 to 1990	External
MAX2401ETI	-40°C to +85°C	28 Thin QFN-EP*	W-CDMA Band III	3.84	1805 to 1880	On-Chip
MAX2401ETI+	-40°C to +85°C	28 Thin QFN-EP*	W-CDMA Band III	2.84	1805 to 1880	On-Chip

*EP = Exposed paddle. + Denotes lead-free package.

MAX2390-MAX2393/MAX2396/MAX2400/MAX2401

W-CDMA/W-TDD/TD-SCDMA Zero-IF Receivers

ABSOLUTE MAXIMUM RATINGS

V _{CC} to GND	-0.3V to +3.6V
All Other Pins to GND	-0.3V to (V _{CC} + 0.3V)
LNA_IN	+15dBm
Digital Input Current	±10mA
Digital Output Open-Collector Current	1mA
Continuous Power Dissipation (T _A = +70°C) 28-Pin QFN (derate 20.8mW/°C above +70°C)	1666.7mW

Operating Temperature Range	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +160°C
Lead Temperature (soldering, 10s)	+300°C

CAUTION! ESD SENSITIVE DEVICE

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = 2.7V to 3.3V, V_{SHDN} = V_{DH} (Note 1), G_{_LNA} = G_{_MXR} = V_{IH}, HGML mode (see Table 6), no RF input signals, RF input and output ports are terminated into 50Ω, baseband I and Q outputs loaded with 10kΩ II 5pF, V_{AGC} = 2.2V, T_A = -40°C to +85°C. Typical values are for V_{CC} = 2.8V, T_A = +25°C, unless otherwise noted.)

Pin Description

PIN	NAME	FUNCTION
1	VCC	Supply Pin for I/Q Mixers. This pin must be bypassed to system ground as close to the pin as possible. The ground vias for the bypass capacitor should not be shared by any other branch. Use 100pF for RF bypassing to GND.
2	RF+	Noninverting RF Input to Zero-IF Demodulator (200Ω Differential Nominal Impedance Between RF+ and RF-)
3	RF-	Inverting RF Input to Zero-IF Demodulator (200Ω Differential Nominal Impedance Between RF+ and RF-)
4	BIAS	External Bias Resistor Connection
5	VCC	Supply Pin for LNA. This pin must be bypassed to system ground as close to the pin as possible. The ground vias for the bypass capacitor should not be shared by any other branch. Use 100pF for RF bypassing to GND.
6	G_LNA	LNA Gain Mode Logic-Control Pin
7	LNA_OUT	LNA Output. Internally matched to 50Ω.
8	GND	RF Ground Return for LNA. Provide multiple vias to the system ground plane as close to the pin as possible.
9	LNA_IN	LNA Input. Externally matched to 50Ω. See the <i>Applications Information</i> section for more information.
10	GND	RF VCO Varactor Ground Return. Provide multiple vias to the system ground plane as close to the pin as possible.
11	VCC	Supply Pin for VCO. This pin must be bypassed to system ground as close to the pin as possible. The ground vias for the bypass capacitor should not be shared by any other branch. Use 100pF for RF bypassing to GND.
12	TUNE	RF VCO Varactor TUNE Input. Connect PLL loop filter between CP and TUNE.
13	CP	(MAX2390-MAX2393, MAX2401) High-Impedance Output of the RF Charge Pump. The RF PLL's loop filter is connected between this pin and TUNE.
	LO_OUT+	(MAX2396/MAX2400) VCO Divide-by-3 Noninverting Output to Synthesizer
14	VCC	(MAX2390-MAX2393, MAX2401) Supply Pin for Synthesizer Charge Pump. Use 100nF for bypassing to GND.
	LO_OUT-	(MAX2396/MAX2400) VCO Divide-by-3 Inverting Output to Synthesizer
15	VCC	Supply Pin for On-Chip Digital Circuitry. Use 100nF for bypassing to GND.
16	REFIN	Synthesizer Reference Frequency Input. AC-couple to the reference source through 1nF.
17	LD	(MAX2390-MAX2393, MAX2401) Open-Drain Output Indicating LOCK Status of the RF PLL. It is open drain to wire-OR with LD from TX chip.
	IDLE	(MAX2396/MAX2400) Idle Mode Enable. Drive IDLE low to disable all blocks except serial bus, VCO, and divide-by-3 prescaler to PLL.
18	SHDN	Shutdown Logic Pin for Entire Receiver (Active Low)
19	AGC	Analog Input Pin Controlling the Baseband VGA Gain
20	Q+	Noninverting Baseband Output for Q Channel
21	Q-	Inverting Baseband Output for Q Channel
22	I-	Inverting Baseband Output for I Channel
23	I+	Noninverting Baseband Output for I Channel
24	VCC	Supply Pin for Baseband Circuitry. Use 100nF for bypassing to GND.
25	CS	3-Wire Serial Bus Enable Input (Active Low)
26	G_MXR	Mixer Gain Mode Logic-Control Pin
27	SDATA	3-Wire Serial Bus Data Input
28	SCLK	3-Wire Serial Bus Clock Input

Detailed Description

With the exception of the analog-input AGC, all functionality of these direct-conversion receivers can be controlled through the 3-wire serial interface (SPI™/QSPI™/MICROWIRE™ compatible).

Register Definition

All devices in this family have two programmable 20-bit registers: the configuration register (CONFIG) and the control register (OPCNTRL). The MAX2391/MAX2392/MAX2393/MAX2401 have two additional programmable 20-bit registers: the main PLL divide register (RFM) and the reference PLL divide register (RFR). The 4 least significant bits of the data sent are the register's address. The 16 most significant bits are used for register data. All registers contain a few don't care bits. These can be either 0 or 1 and do not affect operation. Tables 1a and 1b provide a register summary. Data is shifted in MSB first. When CS is low, data is shifted with the rising edge of the clock. When CS transitions to high, the shift register is latched into the register selected by the contents of the address bits. Power-up defaults for the four registers are shown in Table 2.

The RFM register sets the main-frequency divide ratio for the RF PLL. The RFR register sets the reference-frequency divide ratio. The RF LO frequency can be determined by the following:

$$\text{RF LO frequency} = f_{\text{REFIN}} \times (\text{RFM} / \text{RFR})$$

where FREFIN is the external input reference frequency

MICROWIRE is a trademark of National Semiconductor Corp.

SPI and QSPI are trademarks of Motorola, Inc.

MAX2390-MAX2393/MAX2396/MAX2400/MAX2401

W-CDMA/W-TDD/TD-SCDMA Zero-IF Receivers

Applications Information

LNA and RFIN Matching

The LNA requires a simple two-element 50Ω matching network at the input. Use the layout and matching network provided in the EV kit as a reference. The LNA input is internally biased, so be sure to use a series 100pF DC blocking capacitor in front of the matching network.

The LNA offers a 23dB gain step with less than 10 degrees phase change, selectable with either a dedicated logic pin (G_LNA) or bit 3 in the operation control register (OPCTRL.GLNA).

LNA output matching is provided on-chip, offering better than 2:1 VSWR. The required DC blocking capacitor is provided on-chip, so the LNA output can be connected directly to the RF SAW filter or balun.

I/Q Mixers

The mixers' differential input impedance is 200Ω , allowing an easy interface to commercially available differential-output Rx SAW filters or 1:4 baluns. No DC blocks are required, but a single, small shunt inductor is required to resonate out the parasitic capacitance from the SAW filter and IC package.

The mixer offers an 11dB gain step, which is controlled by either the logic-control pin (G_MXR) or bit 1 of the operation control register (OPCTRL.GMXR). This offers the option to switch the mixer into a low-gain state if required, reducing current consumption by about 3mA. Use the mixer gain step and AGC before reducing LNA gain for optimum receiver dynamic range.

Baseband I/Q Filters

All receiver channel selectivity is implemented fully on-chip, with greater than 40dB adjacent channel selectivity (ACS). This eliminates the need for any additional filtering by any subsequent baseband processor.

The group delay of the integrated filters is compensated through on-chip equalizers for optimum EVM.

AGC

The AGC circuitry of the baseband amplifiers offers linear (dB/V) gain control for the receiver. With the AGC voltage from 0.3V to 2.4V, the VGA section provides 60dB gain-control range, for a total of 95dB including the LNA and mixer gain steps.

The AGC control line has an input impedance of more than $100\text{k}\Omega$ at DC. Internal capacitance creates a single

pole at approximately 2MHz; this provides some high-frequency filtering, thereby reducing AM distortion.

For applications using a baseband processor with digital-only AGC, Maxim offers an 8-bit voltage-output AGC DAC with an SPI/QSPI/MICROWIRE interface in a tiny 6-pin SOT23 package. Especially designed as a low-cost, all-in-one solution for cellular handset AGC, the MAX5383 offers the following features: a serial interface good to 10MHz, guaranteed operation from a 2.7V to 3.6V supply, on-chip 2V reference, $<\pm 10\%$ full-scale error, $<\pm 1\text{LSB}$ INL/DNL, $<1\mu\text{A}$ shutdown, and a minuscule $150\mu\text{A}$ supply current. See the *Typical Application Circuits* for example application circuits using an external AGC DAC.

DC Offset Correction

For optimum IP2 and lowest DC offset at the baseband outputs, a 3-pole Butterworth highpass filter is implemented on-chip. In normal operation, this highpass corner is set to 8.6kHz. The corner frequency is chosen to optimize DC settling time when the system is faced with large DC transients due to an LNA gain step or a large AGC change between receive bursts.

An additional adaptive DC-cancellation mode has been implemented, which is activated for any of the following events: IC is enabled with $\overline{\text{IDLE}}$, IC is enabled with $\overline{\text{SHDN}}$, an LNA gain step (through logic pin or register setting), or a mixer gain step (through logic pin or register setting). This adaptive DC correction loop further minimizes DC settling time for cases where large DC errors are introduced. For further flexibility, the SPI interface can be used to sequence the DC cancellation loop through different time constants (see Table 3).

Baseband I/Q Interface

The baseband I and Q differential outputs are designed for a 150mVRMS W-CDMA combined signal plus noise. The 8dB peak-to-average ratio of the forward W-CDMA channel brings the typical voltage at the baseband outputs to 1.0Vp-p. The baseband amplifiers' outputs are DC-coupled, and offer a programmable common-mode voltage to address the requirements of different baseband processors' ADCs. The output common-mode voltage is 1.2V with OPCTRL VCM = 0, and 1.4V for VCM = 1 (see Table 2 for the OPCTRL register definitions).

These outputs are designed for a minimum load of $10\text{k}\Omega$ (differential) in parallel with 5pF .

W-CDMA/W-TDD/TD-SCDMA Zero-IF Receivers

Synthesizer and LO Generation

The MAX2390–MAX2393, MAX2401 incorporate an integer-N synthesizer on-chip, including the VCO, tank, all dividers, phase comparator, etc. Only a TCXO and a loop filter are required as external components. The LO leakage at the LNA input is minimized by running the internal VCO at 2x the desired LO frequency. The typical application uses a comparison frequency of 200kHz—the channel raster for 3GPP-FDD and -TDD systems.

There are no special requirements for the synthesizer loop filter. The EV kits use a classic Type-II loop filter, with a bandwidth of about 20kHz. This ensures a 200 μ s settling time for a 60MHz frequency jump.

Use a 1nF DC-blocking capacitor in series with the reference oscillator input so as not to disturb the DC bias.

The MAX2396/MAX2400 integrate the VCO and the divide-by-2 for the LO generation, but do not include the synthesizer. The LO leakage at the LNA input is minimized by running the VCO at twice the desired RF frequency. The VCO signal is made available to the external PLL through an on-chip divide-by-three prescaler. Since $f_{VCO_OUTPUT} = f_{VCO} / 3$, and $f_{RFLO} = f_{VCO} / 2$, then $f_{VCO_OUTPUT} = (2/3)f_{RFLO}$. That is, when the RFLO of the MAX2400 is running at midband (1960MHz), the VCO output and the synthesizer are running at 1306.67MHz.

MAX2390–MAX2393/MAX2396/MAX2400/MAX2401
