**PROGRAMMABLE FLEXPC™
 CLOCK FOR P4 PROCESSOR**

**IDTCV132B
 ADVANCE
 INFORMATION**

FEATURES:

- 3 PLL architecture
- USB48 has 180° phase difference from DOT48 and VCH
- 3V66 lead PCI 1.5ns to 3.5ns
- Band-gap circuit for differential output
- High power-noise rejection ratio
- 100MHz to 200MHz CPU frequency
- VCO frequency up to 1.1G
- Support index block read/write
- All CPU-Stop and PCI-Stop related functions are removed
- Available in SSOP package

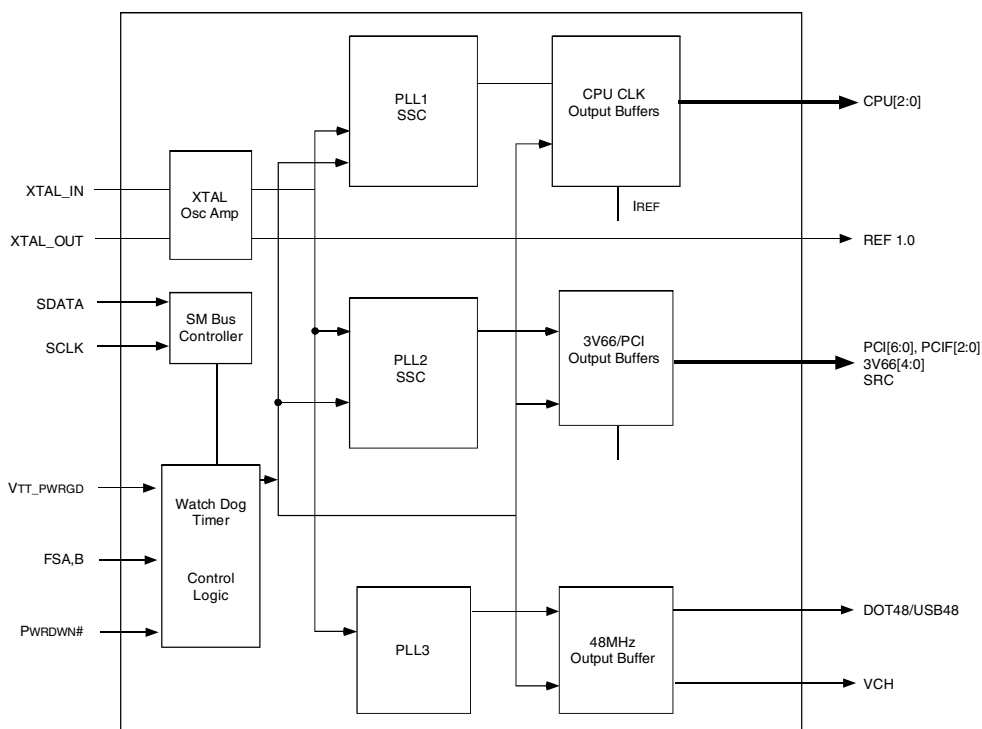

DESCRIPTION:

IDTCV132B is a 56 pin clock device for Intel springdale chip set and for Intel advance P4 processors. This device also implements Band-gap referenced IREF to reduce the impact of V_{DD} variation on differential outputs, which can provide more robust system performance.

KEY SPECIFICATIONS:

- CPU/SRC CLK cycle to cycle jitter < 125ps
- PCI CLK cycle to cycle jitter < 250ps

NOTES:

1. This parameter is guaranteed by design, but not 100% production tested.
2. All long term accuracy and clock period specifications are guaranteed with the assumption that the REF output is at 14.31818MHz.

PD#, POWER DOWN

PD# is an asynchronous active low input used to shut off all clocks cleanly prior to clock power. When PD# is asserted low all clocks will be driven low before turning off the VCO. In PD# de-assertion all clocks will start without glitches.

PWRDWN#	CPU	CPU#	SRC	SRC#	PCIF/PCI	USB	3V66	REF
1	Normal	Normal	Normal	Normal	33MHz	48MHz	66MHz	14.318MHz
0	IREF * 2 or float	Float	IREF * 2 or float	Float	Low	High	Low	14.318MHz

PD# ASSERTION

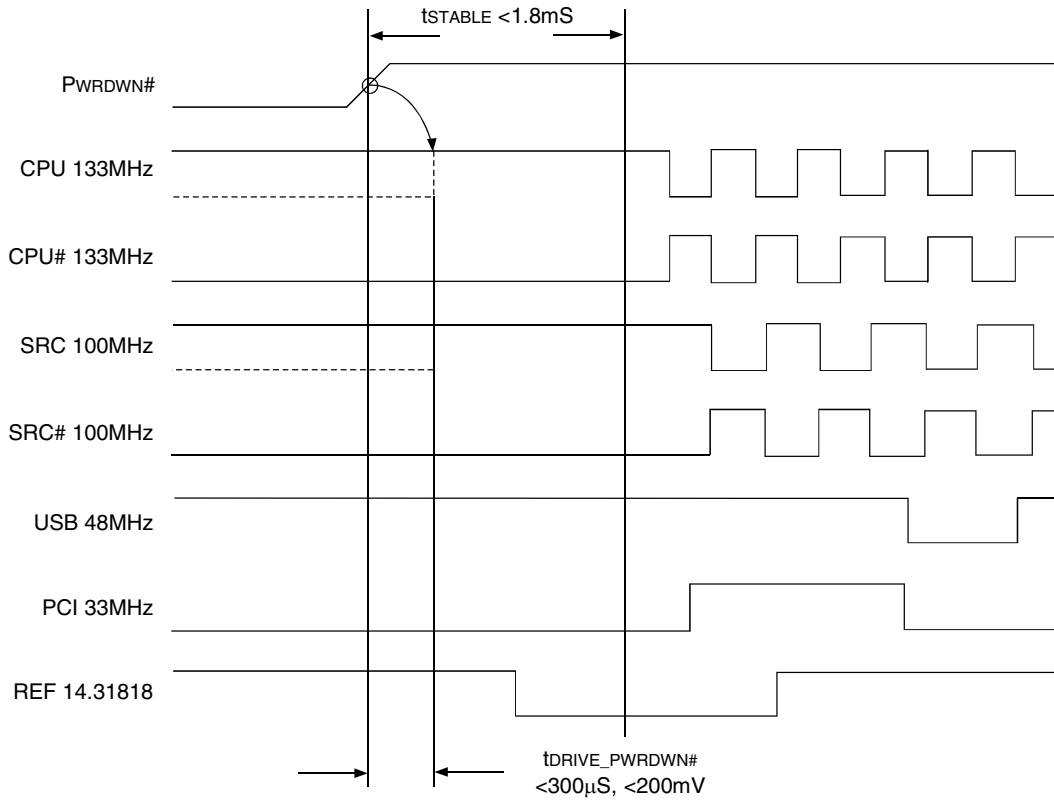

PD# should be sampled low by two consecutive CPU# rising edges before stopping clocks. All single-ended clocks will be held low on their next high to low transition. All differential clocks will be held high on the next high to low transition of the complimentary clock. If the control register determining to drive mode is set to 'tri-state', the differential pair will be stopped in tri-state mode, undriven. When the drive mode but corresponding to the CPU or SRC clock of interest is set to '0' the true clock will be driven high at 2 x IREF and the complementary clock will be tristated. If the control register is programmed to '1' both clocks will be tristated.

PD# DE-ASSERTION

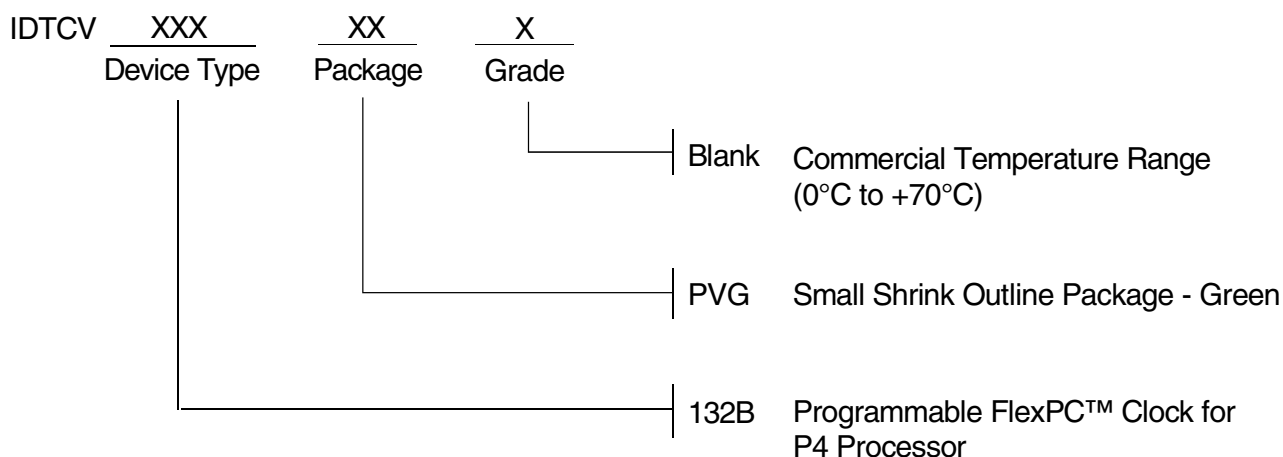

The time from the de-assertion of PD# or until power supply ramps to get stable clocks will be less than 1.8ms. If the drive mode control bit for PD# tristate is programmed to '1' the stopped differential pair must first be driven high to a minimum of 200mV in less than 300µs of PD# deassertion.
