## 20-W Stereo Digital Audio Power Amplifier with EQ and DRC

## FEATURES

Audio Input/Output

**Texas** 

INSTRUMENTS

- 20-W into an 8-Ω Load From an 18-V Supply
- Two Serial Audio Inputs (Four Audio Channels)
- **TAS5706A Supports:** 
  - 2-Ch Bridged Outputs (20 W × 2)
- **TAS5706B Supports:** 
  - 2-Ch Bridged Outputs (20 W × 2)
  - 4-Ch Single-Ended Outputs (10 W × 4)
  - 2-Ch Single-Ended + 1-Ch Bridged (2.1 Mode) (10 W × 2 + 20 W)
- Supports 32-kHz–192-kHz Sample Rates  $(LJ/RJ/I^2S)$
- **Closed Loop Power Stage Architecture** 
  - Improved PSRR Reduces Power Supply **Performance Requirements**
  - Higher Damping Factor Provides for Tighter, More Accurate Sound With **Improved Bass Response**
  - Constant Output Power Over Variation in Supply
- Wide PVCC Range From (10 V to 26 V)
  - No Separate Supply Required for Gate Drive
- **Headphone PWM Outputs**
- Subwoofer PWM Outputs
- AM Interference Avoidance Support
- Audio/PWM Processing
  - Independent Channel Volume Controls With 48-dB to -79-dB Range-Soft Mute (50% Duty Cycle)
  - Programmable Dynamic Range Control
  - 7 Programmable Biguads for Speaker **Equalization for Left and Right Channels**
  - 4 Programmable Biguads for Bass

Processing

- Adaptive Biguad Coefficients for EQ and **DRC Filters**
- **Programmable Input and Output Mixers**
- Automatic Sample-Rate Detection and **Coefficient Banking**
- **General Features** 
  - **Serial Control Interface Operational Without** MCLK
  - Factory-Trimmed Internal Oscillator Avoids the Need for External Crystal
  - Surface Mount, 64-Terminal, 10-mm × 10-mm HTQFP Package
  - Thermal and Short-Circuit Protection

## DESCRIPTION

The TAS5706A/B is a 20-W, efficient, digital audio power amplifier for driving stereo bridged-tied speakers. Two serial data inputs allow processing of up to four discrete audio channels and seamless integration to most digital audio processors and MPEG decoders, accepting a wide range of input data and clock rates. A fully programmable data path allows these channels to be routed to the internal speaker drivers or output via the subwoofer or headphone PWM outputs.

The TAS5706A/B is a slave-only device receiving all clocks from external sources. The TAS5706A/B operates at a 384-kHz switching rate for 32-, 48-, 96-, and 192-kHz data, and at a 352.8 kHz switching rate for 44.1-, 88.2-, and 176.4-kHz data. The 8x oversampling combined with the fourth-order noise shaper provides a flat noise floor and excellent dynamic range from 20 Hz to 20 kHz.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet. PurePath Digital is a trademark of Texas Instruments.

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

#### PIN FUNCTIONS

| PIN      | PIN |     | 5-V      | TERMINATION | DESCRIPTION   |
|----------|-----|-----|----------|-------------|---|
| NAME     | NO. | (1) | TOLERANT | (2)         | DESCRIPTION   |
| AGND     | 57  | Р   |          |             | Analog ground for power stage   |
| AVCC     | 58  | Ρ   |          |             | Analog power supply for power stage. Connect externally to same potential as PVCC.  |
| AVDD     | 10  | Р   |          |             | 3.3-V analog power supply   |
| AVSS     | 11  | Р   |          |             | Analog 3.3-V supply ground  |
| BKND_ERR | 35  | DI  |          | Pullup      | Active-low. A back-end error sequence is generated by applying logic LOW to this terminal. This terminal is connected to an external power stage. If no external power stage is used, connect this terminal directly to DVDD. |

(1) TYPE: A = analog; D = 3.3-V digital; P = power/ground/decoupling; I = input; O = output

(2) All pullups are 20-µA weak pullups and all pulldowns are 20-µA weak pulldowns. The pullups and pulldowns are included to assure proper input logic levels if the terminals are left unconnected (pullups → logic 1 input; pulldowns → logic 0 input). Devices that drive inputs with pullups must be able to sink 20 µA while maintaining a logic-0 drive level. Devices that drive inputs with pulldowns must be able to source 20 µA while maintaining a logic-1 drive level.

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

| PIN      |           | TYPE | 5-V      | TERMINATION | DESCRIPTION   |
|----------|-----------|------|----------|-------------|---|
| NAME     | NO.       | (1)  | TOLERANT | (2)         | DESCRIPTION   |
| BST_A    | 59        | Р    |          |             | High-side bootstrap supply for half-bridge A  |
| BST_B    | 61        | Р    |          |             | High-side bootstrap supply for half-bridge B  |
| BST_C    | 53        | Р    |          |             | High-side bootstrap supply for half-bridge C  |
| BST_D    | 55        | Р    |          |             | High-side bootstrap supply for half-bridge D  |
| BYPASS   | 56        | 0    |          |             | Nominally equal to V <sub>CC</sub> /8. Internal reference voltage for analog cells  |
| DVDD     | 15,<br>33 | Ρ    |          |             | 3.3-V digital power supply  |
| DVSS     | 20,<br>26 | Ρ    |          |             | Digital ground  |
| HPL_PWM  | 37        | DO   |          |             | Headphone left-channel PWM output.  |
| HPR_PWM  | 38        | DO   |          |             | Headphone right-channel PWM output.   |
| HPSEL    | 30        | DI   | 5-V      |             | Headphone select, active high. When a logic HIGH is applied, device<br>enters headphone mode and speakers are HARD MUTED. When a<br>logic LOW is applied, device is in speaker mode and headphone<br>outputs become line outputs or are disabled.   |
| LRCLK    | 22        | DI   | 5-V      |             | Input serial audio data left/right clock (sampling rate clock)  |
| MCLK     | 34        | DI   | 5-V      |             | MCLK is the clock master input. The input frequency of this clock can range from 4.9 MHz to 49 MHz.   |
| MUTE     | 21        | DI   | 5-V      | Pullup      | Performs a soft mute of outputs, active-low. A logic low on this terminal sets the outputs equal to 50% duty cycle. A logic high on this terminal allows normal operation. The mute control provides a noiseless volume ramp to silence. Releasing mute provides a noiseless ramp to previous volume. |
| OSC_RES  | 19        | AO   |          |             | Oscillator trim resistor. Connect an 18.2-kΩ resistor to GND.   |
| OUT_A    | 4, 5      | 0    |          |             | Output, half-bridge A   |
| OUT_B    | 1, 64     | 0    |          |             | Output, half-bridge B   |
| OUT_C    | 49,<br>50 | 0    |          |             | Output, half-bridge C   |
| OUT_D    | 45,<br>46 | 0    |          |             | Output, half-bridge D   |
| PDN      | 17        | DI   | 5-V      | Pullup      | Power down, active-low. PDN powers down all logic, stops all clocks, and outputs stops switching. When PDN is released, the device powers up all logic, starts all clocks, and performs a soft start that returns to the previous configuration determined by register settings.                      |
| PGND_A   | 6, 7      | Р    |          |             | Power ground for half-bridge A  |
| PGND_B   | 2, 3      | Р    |          |             | Power ground for half-bridge B  |
| PGND_C   | 47,<br>48 | Р    |          |             | Power ground for half-bridge C  |
| PGND_D   | 43,<br>44 | Ρ    |          |             | Power ground for half-bridge D  |
| PLL_FLTM | 12        | AO   |          |             | PLL negative input  |
| PLL_FLTP | 13        | AI   |          |             | PLL positive input  |
| PVCC_A   | 8, 9      | Р    |          |             | Power supply input for half-bridge output A   |
| PVCC_B   | 62,<br>63 | Р    |          |             | Power supply input for half-bridge output B   |
| PVCC_C   | 51,<br>52 | Р    |          |             | Power supply input for half-bridge output C   |
| PVCC_D   | 41,<br>42 | Ρ    |          |             | Power supply input for half-bridge output D   |

## **PIN FUNCTIONS (continued)**

| PIN       |     | TYPE | 5-V      | TERMINATION | DESCRIPTION   |
|-----------|-----|------|----------|-------------|---|
| NAME      | NO. | (1)  | TOLERANT | (2)         | DESCRIPTION   |
| RESET     | 16  | DI   | 5-V      | Pullup      | Reset, active-low. A system reset is generated by applying a logic low to this terminal. RESET is an asynchronous control signal that restores the DAP to its default conditions, sets the VALID outputs low, and places the PWM in the hard-mute state (stops switching). Master volume is immediately set to full attenuation. Upon the release of RESET, if PDN is high, the system performs a 4- to 5-ms device initialization and sets the volume at mute. |
| SCL       | 29  | DI   | 5-V      |             | I <sup>2</sup> C serial control clock input   |
| SCLK      | 23  | DI   | 5-V      |             | Serial audio data clock (shift clock). SCLK is the serial audio port input data bit clock.  |
| SDA       | 28  | DIO  | 5-V      |             | I <sup>2</sup> C serial control data interface input/output   |
| SDIN1     | 25  | DI   | 5-V      |             | Serial audio data-1 input is one of the serial data input ports. SDIN1 supports three discrete (stereo) data formats.   |
| SDIN2     | 24  | DI   | 5-V      |             | Serial audio data-2 input is one of the serial data input ports. SDIN2 supports three discrete (stereo) data formats.   |
| STEST     | 31  | DI   |          |             | Test terminal. Connect directly to GND.   |
| SUB_PWM-  | 39  | DO   |          |             | Subwoofer negative PWM output   |
| SUB_PWM+  | 40  | DO   |          |             | Subwoofer positive PWM output   |
| TEST2     | 32  | DI   |          |             | Test terminal. Connect directly to DVDD.  |
| VALID     | 36  | DO   |          |             | Output indicating validity of ALL PWM channels, active-high. This terminal is connected to an external power stage. If no external power stage is used, leave this terminal floating.   |
| VCLAMP_AB | 60  | Ρ    |          |             | Internally generated voltage supply for channels A and B gate drive.<br>Not to be used as a supply or connected to any component other than<br>the decoupling capacitor   |
| VCLAMP_CD | 54  | Ρ    |          |             | Internally generated voltage supply for channels C and D gate drive.<br>Not to be used as a supply or connected to any component other than<br>the decoupling capacitor   |
| VR_ANA    | 14  | Р    |          |             | Internally regulated 1.8-V analog supply voltage. This terminal must not be used to power external devices.   |
| VR_DIG    | 27  | Р    |          |             | Internally regulated 1.8-V digital supply voltage. This terminal must not be used to power external devices.  |
| VREG_EN   | 18  | DI   |          | Pulldown    | Voltage regulator enable. Connect directly to GND.  |

## DETAILED DESCRIPTION

## POWER SUPPLY

The digital portion of the chip requires 3.3 V, and the power stages can work from 10 V to 26 V.

## CLOCK, AUTO DETECTION, AND PLL

The TAS5706A DAP is a slave device. It accepts MCLK, SCLK, and LRCLK. The digital audio processor (DAP) supports all the sample rates and MCLK rates that are defined in the clock control register.

The TAS5706A checks to verify that SCLK is a specific value of 32  $f_S$ , 48  $f_S$ , or 64  $f_S$ . The DAP only supports a 1 x  $f_S$  LRCLK. The timing relationship of these clocks to SDIN1/2 is shown in subsequent sections. The clock section uses MCLK or the internal oscillator clock (when MCLK is unstable or absent) to produce the internal clock.

The DAP can autodetect and set the internal clock control logic to the appropriate settings for the frequencies of 32 kHz, normal speed (44.1 or 48 kHz), double speed (88.2 kHz or 96 kHz), and quad speed (176.4 kHz or 192 kHz). The automatic sample rate detection can be disabled and the values set via I<sup>2</sup>C in the clock control register.

The DAP also supports an AM interference-avoidance mode during which the clock rate is adjusted, in concert with the PWM sample rate converter, to produce a PWM output at  $7 \times f_S$ ,  $8 \times f_S$ , or  $6 \times f_S$ .

The sample rate must be set manually during AM interference avoidance and when de-emphasis is enabled.

#### SERIAL DATA INTERFACE

Serial data is input on SDIN1/2. The PWM outputs are derived from SDIN1/2. The TAS5706A DAP accepts 32-, 44.1-, 48-, 88.2-, 96-, 176.4-, and 192-kHz serial data in 16-, 18-, 20-, or 24-bit data in left-justified, right-justified, and I<sup>2</sup>S serial data formats.

## **PWM Section**

The TAS5706A DAP device uses noise-shaping and sophisticated error correction algorithms to achieve high power efficiency and high-performance digital audio reproduction. The DAP uses a fourth-order noise shaper that has >100-dB SNR performance from 20 Hz to 20 kHz. The PWM section accepts 24-bit PCM data from the DAP and outputs four PWM audio output channels. TAS5706A PWM section output supports bridge-tied loads.

The PWM section has individual channel dc blocking filters that can be enabled and disabled. The filter cutoff frequency is less than 1 Hz. Individual channel de-emphasis filters for 32-, 44.1-, and 48-kHz are included and can be enabled and disabled.

Finally, the PWM section has an adjustable maximum modulation limit of 93.8% to 99.2%.

## I<sup>2</sup>C COMPATIBLE SERIAL CONTROL INTERFACE

The TAS5706A DAP has an I<sup>2</sup>C serial control slave interface to receive commands from a system controller. The serial control interface supports both normal-speed (100-kHz) and high-speed (400-kHz) operations without wait states. As an added feature, this interface operates even if MCLK is absent.

The serial control interface supports both single-byte and multi-byte read and write operations for status registers and the general control registers associated with the PWM.

The  $I^2C$  interface supports a special mode which permits  $I^2C$  write operations to be broken up into multiple-data write operations that are multiples of 4 data bytes. These are 6-, 10-, 14-, 18-, ... etc., -byte write operations that are composed of a device address, read/write bit, subaddress, and any multiple of 4 bytes of data. This permits the system to write large register values incrementally without blocking other  $I^2C$  transactions.

### I<sup>2</sup>S Timing

I<sup>2</sup>S timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is low for the left channel and high for the right channel. A bit clock running at 32, 48, or  $64 \times f_S$  is used to clock in the data. There is a delay of one bit clock from the time the LRCLK signal changes state to the first bit of data on the data lines. The data is written MSB first and is valid on the rising edge of bit clock. The DAP masks unused trailing data bit positions.

2-Channel I<sup>2</sup>S (Philips Format) Stereo Input

NOTE: All data presented in 2s-complement form with MSB first.

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

www.ti.com

#### Left-Justified

Left-justified (LJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is high for the left channel and low for the right channel. A bit clock running at 32, 48, or  $64 \times f_S$  is used to clock in the data. The first bit of data appears on the data lines at the same time LRCLK toggles. The data is written MSB first and is valid on the rising edge of the bit clock. The DAP masks unused trailing data bit positions.

## **Right-Justified**

Right-justified (RJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is high for the left channel and low for the right channel. A bit clock running at 32, 48, or 64 x  $f_S$  is used to clock in the data. The first bit of data appears on the data 8 bit-clock periods (for 24-bit data) after LRCLK toggles. In RJ mode the LSB of data is always clocked by the last bit clock before LRCLK transitions. The data is written MSB first and is valid on the rising edge of bit clock. The DAP masks unused leading data bit positions.

#### SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

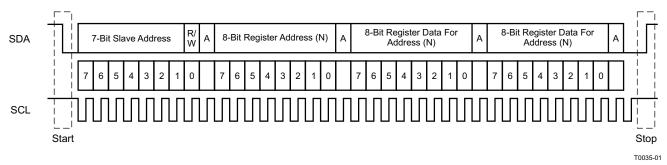

#### I<sup>2</sup>C SERIAL CONTROL INTERFACE

The TAS5706A DAP has a bidirectional  $I^2C$  interface that compatible with the  $I^2C$  (Inter IC) bus protocol and supports both 100-kHz and 400-kHz data transfer rates for single and multiple byte write and read operations. This is a slave only device that does not support a multimaster bus environment or wait state insertion. The control interface is used to program the registers of the device and to read device status.

The DAP supports the standard-mode  $I^2C$  bus operation (100 kHz maximum) and the fast  $I^2C$  bus operation (400 kHz maximum). The DAP performs all  $I^2C$  operations without  $I^2C$  wait cycles.

#### General I<sup>2</sup>C Operation

The I<sup>2</sup>C bus employs two signals; SDA (data) and SCL (clock), to communicate between integrated circuits in a system. Data is transferred on the bus serially one bit at a time. The address and data can be transferred in byte (8-bit) format, with the most significant bit (MSB) transferred first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data terminal (SDA) while the clock is high to indicate a start and stop conditions. A high-to-low transition on SDA indicates a start and a low-to-high transition indicates a stop. Normal data bit transitions must occur within the low time of the clock period. These conditions are shown in Figure 39. The master generates the 7-bit slave address and the read/write (R/W) bit to open communication with another device and then waits for an acknowledge condition. The TAS5706A holds SDA low during the acknowledge clock period to indicate an acknowledgment. When this occurs, the master transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus R/W bit (1 byte). All compatible devices share the same signals via a bidirectional bus using a wired-AND connection. An external pullup resistor must be used for the SDA and SCL signals to set the high level for the bus.

#### Figure 39. Typical I<sup>2</sup>C Sequence

There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the master generates a stop condition to release the bus. A generic data transfer sequence is shown in Figure 39.

The 7-bit address for TAS5706A is 0011 011 (0x36).

#### Single- and Multiple-Byte Transfers

The serial control interface supports both single-byte and multiple-byte read/write operations for status registers and the general control registers associated with the PWM. However, for the DAP data processing registers, the serial control interface supports only multiple-byte (4-byte) read/write operations.

During multiple-byte read operations, the DAP responds with data, a byte at a time, starting at the subaddress assigned, as long as the master device continues to respond with acknowledges. If a particular subaddress does not contain 32 bits, the unused bits are read as logic 0.

During multiple-byte write operations, the DAP compares the number of bytes transmitted to the number of bytes that are required for each specific subaddress. If a write command is received for a biquad subaddress, the DAP expects to receive five 32-bit words. If fewer than five 32-bit data words have been received when a stop command (or another start command) is received, the data received is discarded. Similarly, if a write command is received for a mixer coefficient, the DAP expects to receive one 32-bit word.

TAS5706A is Not Recommended for New Designs

TAS5706A TAS5706B

www.ti.com

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

Supplying a subaddress for each subaddress transaction is referred to as random  $I^2C$  addressing. The TAS5706A also supports sequential  $I^2C$  addressing. For write transactions, if a subaddress is issued followed by data for that subaddress and the 15 subaddresses that follow, a sequential  $I^2C$  write transaction has taken place, and the data for all 16 subaddresses is successfully received by the TAS5706A. For  $I^2C$  sequential write transactions, the subaddress then serves as the start address, and the amount of data subsequently transmitted, before a stop or start is transmitted, determines how many subaddresses are written. As was true for random addressing, sequential addressing requires that a complete set of data be transmitted. If only a partial set of data is written to the last subaddress, the data for the last subaddress is discarded. However, all other data written is accepted; only the incomplete data is discarded.

#### Single-Byte Write

As shown in Figure 40, a single-byte data write transfer begins with the master device transmitting a start condition followed by the I<sup>2</sup>C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write data transfer, the read/write bit will be a 0. After receiving the correct I<sup>2</sup>C device address and the read/write bit, the DAP responds with an acknowledge bit. Next, the master transmits the address byte or bytes corresponding to the TAS5706A internal memory address being accessed. After receiving the data byte, the TAS5706A again responds with an acknowledge bit. Next, the master device transmits the data byte to be written to the memory address being accessed. After receiving the data byte, the TAS5706A again responds with an acknowledge bit. Next, the master device transmits the single-byte data write transfer.

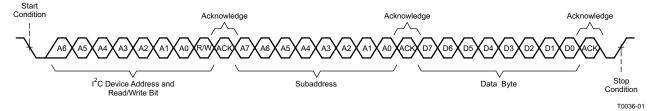

Figure 40. Single-Byte Write Transfer

#### **Multiple-Byte Write**

A multiple-byte data write transfer is identical to a single-byte data write transfer except that multiple data bytes are transmitted by the master device to the DAP as shown in Figure 41. After receiving each data byte, the TAS5706A responds with an acknowledge bit.

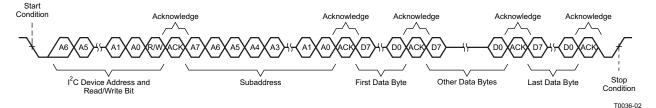

Figure 41. Multiple-Byte Write Transfer

TAS5706A is Not Recommended for New Designs

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

www.ti.com

#### Single-Byte Read

As shown in Figure 42, a single-byte data read transfer begins with the master device transmitting a start condition followed by the I<sup>2</sup>C device address and the read/write bit. For the data read transfer, both a write followed by a read are actually done. Initially, a write is done to transfer the address byte or bytes of the internal memory address to be read. As a result, the read/write bit becomes a 0. After receiving the TAS5706A address and the read/write bit, TAS5706A responds with an acknowledge bit. In addition, after sending the internal memory address byte or bytes, the master device transmits another start condition followed by the TAS5706A address address and the read/write bit again. This time the read/write bit becomes a 1, indicating a read transfer. After receiving the address and the read/write bit, the TAS5706A again responds with an acknowledge bit. Next, the TAS5706A transmits the data byte from the memory address being read. After receiving the data byte, the master device transmits a not acknowledge followed by a stop condition to complete the single byte data read transfer.

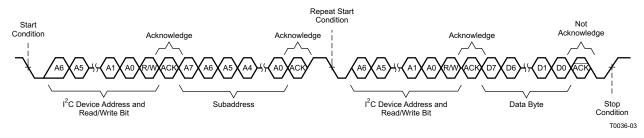

Figure 42. Single-Byte Read Transfer

#### **Multiple-Byte Read**

A multiple-byte data read transfer is identical to a single-byte data read transfer except that multiple data bytes are transmitted by the TAS5706A to the master device as shown in Figure 43. Except for the last data byte, the master device responds with an acknowledge bit after receiving each data byte.

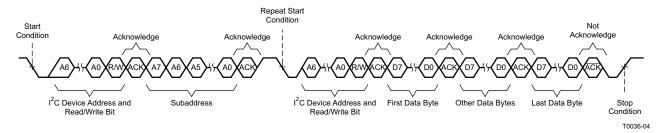

Figure 43. Multiple Byte Read Transfer

www.ti.com

#### **Loudness Function**

The TAS5706A provides a direct form I biquad for loudness on the subwoofer channel. The first biquad is contained in a gain-compensation circuit that maintains the overall system gain at 1 or less to prevent clipping at loud volume settings. This gain compensation is shown in Figure 46

B0273-01

Figure 46. Biquad Gain Control Structure

| Volume      | 0.125 | 0.25 | 0.375 | 0.5   | 0.625 | 0.75  | 0.875 | 1 | 1.125 | 1.25 | 1.375 | 1.5 | 1.625 | 1.75 | 1.875 | 2 |
|-------------|-------|------|-------|-------|-------|-------|-------|---|-------|------|-------|-----|-------|------|-------|---|
| Biquad path | 1     | 1    | 0.833 | 0.666 | 0.5   | 0.333 | 0.166 | 0 | 0     | 0    | 0     | 0   | 0     | 0    | 0     | 0 |
| Direct path | 0     | 0    | 0.166 | 0.333 | 0.5   | 0.666 | 0.833 | 1 | 1     | 1    | 1     | 1   | 1     | 1    | 1     | 1 |
| Total gain  | 1     | 1    | 1     | 1     | 1     | 1     | 1     | 1 | 1     | 1    | 1     | 1   | 1     | 1    | 1     | 1 |

| Table 1. Loudness | Table Example for | Gain = 4, 1/G = 0.2 | 5, Scale = 1.33 |
|-------------------|-------------------|---------------------|-----------------|
|-------------------|-------------------|---------------------|-----------------|

The biquads are implemented in a direct form-I architecture. The direct form-I structure provides a separate delay element and mixer (gain coefficient) for each node in the biquad filter.

The five 26-bit (3.23) coefficients for the biquad are programmable via the I<sup>2</sup>C interface.

The following steps are involved in using a loudness biquad with the volume compensation feature:

- 1. Program the biquad with a loudness filter.
- 2. Program 0x26 (1/G) and 0x28 (scale).
- 3. Enable volume compensation in register 0x0E.

#### BANK SWITCHING

The TAS5706A uses an approach called *bank switching* together with automatic sample-rate detection. All processing features that must be changed for different sample rates are stored internally in the TAS5706A. The TAS5706A has three full banks storing information, one for 32 kHz, one for 44.1/48 kHz, and one for all other data rates. Combined with the clock-rate autodetection feature, bank switching allows the TAS5706A to detect automatically a change in the input sample rate and switch to the appropriate bank without any MCU intervention.

The TAS5706A supports three banks of coefficients to be updated during the initialization. One bank is for 32 kHz , a second bank is for 44.1/48 kHz, and a third bank is for all other sample rates. An external controller updates the three banks (see the  $I^2C$  register mapping table for bankable locations) during the initialization sequence.

If the autobank switch is enabled (register 0x50, bits 2:0), then the TAS5706A automatically swaps the coefficients for subsequent sample rate changes, avoiding the need for any external controller intervention for a sample rate change.

By default, bits 2:0 have the value 000; that means the bank switch is disabled. In that state, any update to locations 0x29–0x3F go into the DAP. A write to register 0x50 with bits 2:0 being 001, 010, or 011 brings the system into the coefficient-bank-update state *update bank1*, *update bank2*, or *update bank3*, respectively. Any subsequent write to locations 0x29-0x3F updates the coefficient banks stored outside the DAP. After updating all the three banks, the system controller should issue a write to register 0x50 with bits 2:0 being 100; this changes the system state to automatic bank update. In automatic bank update, the TAS5706A automatically swaps banks based on the sample rate.

In the headphone mode, speaker equalization and DRC are disabled, and they are restored upon returning to the speaker mode.

#### Command sequences for initialization can be summarized as follows:

- 1. Enable factory trim for internal oscillator: Write to register 0x1B with a value 0x00.
- 2. Update coefficients: Coefficients can be loaded into DAP RAM using the manual bank mode.
  - Use automatic bank mode.
  - a. Enable bank-1 mode: Write to register 0x50 with 0x01. Load the 32-kHz coefficients. TI ALE can generate coefficients.
  - b. Enable bank-2 mode: Write to register 0x50 with 0x02. Load the 48-kHz coefficients.
  - c. Enable bank-3 mode: Write to register 0x50 with 0x03. Load the other coefficients.
- d. Enable automatic bank switching by writing to register 0x50 with 0x04.
- 3. Bring the system out of all-channel shutdown: Write 0 to bit 6 of register 0x05.
- 4. Issue master volume: Write to register 0x07 with the volume value (0 db = 0x30).

TAS5706A TAS5706B

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

#### **APPLICATION INFORMATION**

#### **Recovery From Error**

INSTRUMENTS

#### Protection Mechanisms in the TAS5706A/B

- SCP (short-circuit protection, OCP) protects against shorts across the load, to GND, and to PVCC.
- OTP turns off the device if  $T_{die}$  (typical) > 150°C.
- UVP turns off the device if PVCC (typical) < 8.4 V
- OVP turns off the device if PVCC (typical) > 27.5 V

A short-circuit condition can be detected also by an external controller. The SCP error from the external power stage is also fed into TAS5706A/B. The VALID pin goes low in the event of a short circuit. The VALID pin can be monitored by an external  $\mu$ C. The TAS5706A/B initiates a back-end error sequence by itself to recover from the error, which involves settling VALID low for a programmable amount of time and then retrying to check whether the SCP condition still exists.

- OTP turns on the device back when  $T_{die}$ (typical) < 135°C.
- UVP turns on the device if PVCC (typical) is > 8.5 V.
- OVP turns on the device if PVCC (typical) is < 27.2 V.

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

# Calculation of Output Signal Level of TAS5706A/B Feedback Power Stage (Gain Is independent of PVCC)

The gain of the TAS5706A/B is the total digital gain of the controller multiplied by the gain of the power stage.

For a half-bridge channel of the TAS5706A/B power stage, the gain is simply:

Power stage gain =  $13 \times V_{RMS}$  / Modulation Level

Modulation level = fraction of full-scale modulation of the PWM signal at the input of the power stage.

 $V_{RMS}$  = Audio voltage level at the output of the power stage = 13 × Modulation Level

For the TAS5706A/B controller, the gain is the programmed digital gain multiplied by a scaling factor, called the *maximum modulation level*. The maximum modulation level is derived from the modulation limit programmed in the controller, which limits duty cycle to a set number of percent above 0% and below 100%. Setting the modulation limit to 97.7% (default) limits the duty cycle between 2.3% and 97.7%.

Controller gain = digital gain × maximum modulation level × (modulation level/digital FFS)

Digital FFS = digital input fraction of full scale

Modulation limit = 97.7%

Maximum modulation level =  $2 \times \text{modulation limit} - 1 = 0.954$ 

The output signal level of the TAS5706A/B can now be calculated.

 $V_{RMS}$  = digital FFS × digital gain × maximum modulation level × 13

With the modulation limit set at the default level of 97.7%, this becomes:

 $V_{RMS}$  = digital FFS x digital gain x 12.4 (Single-ended)  $V_{RMS}$  = digital FFS x digital gain x 24.8 (BTL)

Example: Input = -20 dbFS; volume = 0 dB; biquads = ALL PASS; modulation index = 97.7%; mode = BTL

Output  $V_{RMS} = 24.8 \times 0.1 \times 1 = 2.48 V$

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

# I<sup>2</sup>C SERIAL CONTROL COMMAND CHARACTERISTICS

The DAP has two groups of I<sup>2</sup>C commands. One set is commands that are designed specifically to be operated while audio is streaming and that have built-in mechanisms to prevent noise, clicks, and pops. The other set does not have this built-in protection.

#### Commands that are designed to be adjusted while audio is streaming:

- Master volume
- Master mute
- Individual channel volume
- Individual channel mute

#### Commands that are normally issued as part of initialization:

- Serial data interface format
- De-emphasis
- Sample-rate conversion
- Input multiplexer
- Output multiplexer
- Biquads
- Down mix
- Channel delay
- Enable/disable dc blocking
- Hard/soft unmute from clock error
- Enable/disable headphone outputs

#### Start-up sequence for correct device operation

This sequence must be followed to ensure proper operation.

- 1. Hold ALL logic inputs low. Power up AVDD/DVDD and wait for the inputs to settle in the allowed range.
- 2. Drive  $\overline{PDN} = 1$ ,  $\overline{MUTE} = 1$ , and drive other logic inputs to the desired state.
- 3. Provide a stable MCLK, LRCLK, and SCLK (clock errors must be avoided during the initialization sequence) .
- 4. After completing step 3, wait 100  $\mu$ s, then drive RESET = 1, and wait 13.5 ms after RESET goes high.
- 5. Trim the internal oscillator (write 0x00 to register 0x1B).
- 6. Wait 50 ms while the part acquires lock.
- 7. Configure the DAP via I<sup>2</sup>C, e.g.:
  - Downmix control (0x21)
  - Biquads (0x23-0x24 and 0x29-0x38)
  - DRC parameters and controls (0x3A–0x46)
  - Bank select (0x50)

NOTE: User may not issue any I<sup>2</sup>C reads or writes to the above registers after this step is complete.

- 8. Configure remaining I<sup>2</sup>C registers, e.g.:
  - Shutdown group
  - De-emphasis
  - Input multiplexers
  - Output multiplexers
  - Channel delays
  - DC blocking
  - Hard/soft unmute from clock error
  - Serial data interface format
  - Clock register (manual clock mode only)

NOTE: The BKND\_ERR register (0x1C) can only be written once with a value that is not reserved (00 and 01 are reserved values).

9. Exit all-channel shutdown (write 0 to bit 6 of register 0x05).

TAS5706A is Not Recommended for New Designs

#### SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

- 10. <u>This completes the initialization sequence</u>. From this step on, no further constraints are imposed on PDN, MUTE, and clocks.
- 11. During normal operation the user may do the following:
  - a. Write to the master or individual-channel volume registers.
  - b. Write to the soft-mute register.
  - c. Write to the clock and serial data interface format registers (in manual clock mode only).
  - d. Write to bit 6 of register 0x05 to enter/exit all-channel shutdown. No other bits of register 0x05 may be altered. After issuing the all-channel shutdown command, no further I<sup>2</sup>C transactions that address this device are allowed for a period of at least: 1 ms + <u>1.3</u> × (period specified in start/stop register 0x1A).
  - e. PDN may be asserted (low) at any time. Once PDN is asserted, no I<sup>2</sup>C transactions that address this device may be issued until PDN has been deasserted and the part has returned to active mode.

NOTE: When the device is in a powered down state (initiated via PDN), the part is not reset if RESET is asserted.

NOTE: Once **RESET** is asserted, and as long as the part is in a reset state, the part does not power down if PDN is asserted. For powering the part down, a negative edge on PDN must be issued when **RESET** is high and the part is not in a reset state.

NOTE: No registers besides those explicitly listed in Steps a.-d. should be altered during normal operation (i.e., after exiting all-channel shutdown).

NOTE: No registers should be read during normal operation (i.e., after exiting all-channel shutdown).

#### 12. To reconfigure registers:

- a. Return to all-channel shutdown (observe the shutdown wait time as specified in Step 11.d.).
- b. Drive  $\overline{PDN} = 1$ , and hold  $\overline{MUTE}$  stable.
- c. Provide a stable MCLK, LRCLK, and SCLK.
- d. Repeat configuration starting from step (6).

#### Table 2. Serial Control Interface Register Summary <sup>(1)</sup>

# CLOCK CONTROL REGISTER (0x00)

In the manual mode, the clock control register provides a way for the system microprocessor to update the data and clock rates based on the sample rate and associated clock frequencies. In the auto-detect mode, the clocks are automatically determined by the TAS5706A. In this case, the clock control register contains the auto-detected clock status as automatically detected (D7–D2). Bits D7–D5 selects the sample rate. Bits D4–D2 select the MCLK frequency. Bit D0 is used in manual mode only. In this mode, when the clocks are updated a 1 must be written to D0 to inform the DAP that the written clocks are valid.

| D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | FUNCTION   |
|----|----|----|----|----|----|----|----|--|

# SYSTEM CONTROL REGISTER 2 (0x05)

Bit D6 is a control bit and bit D5 is a configuration bit.

When bit D6 is set low, the system starts playing; otherwise, the outputs are shut down.

Bit D5 defines the configuration of the system, that is, it determines what configuration the system runs in when bit D6 is set low. When this bit is asserted, all channels are switching. Otherwise, only a subset of the PWM channels will run. The channels to shut down are defined in the shutdown group register (0x19). Bit D5 should only be changed when bit D6 is set, meaning that it is only possible to switch configurations by resetting the DAP and then restarting it again in the new configuration.

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

Bit D3 defines which volume register is used to control the volume of the HP\_PWMx outputs when in headphone mode. When set to 0, the HP volume register (0x0C) controls the volume of the headphone outputs when in headphone mode. When bit D3 is set to 1, the channel volume registers (0x08–0x0B, 0x0D) are used for all modes (line out, headphone, speaker).

Bits D2–D1 define the output modes. The default is speaker mode with the headphone mode selectable via the external **HPSEL** terminal. The device can also be forced into headphone mode by asserting bit D1 (all other PWM channels are muted). Asserting bit D2 puts the device into a pseudo-line-out mode where the HP\_PWMx and all other PWM channels are active. Bit D3 must also be asserted in this mode, and the HP\_PWMx volume is controlled with the main speaker output volume controls via registers 0x08–0x0B and 0x0D.

#### **PWM SHUTDOWN GROUP REGISTER (0x19)**

Settings of this register determine which PWM channels are active. The default is 0x30 for two BTL output channels. The functionality of this register is tied to the state of bit D5 in the system control register. This register should be updated with a value of 0x00 before sending out the all-channel shutdown command to register 0x05.

# START/STOP PERIOD REGISTER (0x1A)

This register is used to control the soft-start and soft-stop period when starting up or shutting down channels. The value in this register determines the time for which the PWM inputs switch at 50% duty cycle. This helps reduce pops and clicks at start-up and shutdown.

D7 is used to configure the output stage in a bridge-tied mode or a single-ended mode.

|    | Table 16. Start/Stop Period Register (0x1A) |    |    |    |    |    |    |  |  |  |  |  |

# **OSCILLATOR TRIM REGISTER (0x1B)**

The TAS5706A PWM processor contains an internal oscillator for PLL reference. This reduces system cost because an external reference is not required. Currently, TI recommends a trim resistor value of 18.2 k $\Omega$  (1%). This should be connected between OSC\_RES and DVSS.

The factory-trim procedure simply enables the factory trim that was previously done at the factory.

Note that trim always must be run following reset of the device.

#### **Oscillator Trim Enable Procedure Example**

Write data 0x00 to register 0x1B (enable factory trim).

| Table 1 | 17. | Oscillator | Trim | Register | (0x1B) |  |
|---------|-----|------------|------|----------|--------|--|
|         |     | OScinator  |      | Register | (0,10) |  |

| -  | -  | -  | -  | -  | -  | I  | 0  | Reserved <sup>(1)</sup>   |

(1) Default values are in **bold**.

# **BKND\_ERR REGISTER (0x1C)**

When a back-end error signal is received ( $\overline{BKND\_ERR} = LOW$ ), all the output stages are reset by setting all PWM, VALID1, and VALID2 signals LOW. Subsequently, the modulator waits approximately for the time listed in Table 18 before initiation of a reset.

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

## PWM OUTPUT MUX REGISTER (0x25)

This DAP output mux selects which internal PWM channel is output to the external pins. Any channel can be output to any external output pin.

| Bits D30–D25: | Selects which PWM channel is output to HPL_PWM and HPR_PWM |
|---------------|--|
| Bits D23–D20: | Selects which PWM channel is output to OUT_A               |
| Bits D19–D16: | Selects which PWM channel is output to OUT_B               |
| Bits D15–D12: | Selects which PWM channel is output to OUT_C               |
| Bits D11–D08: | Selects which PWM channel is output to OUT_D               |
| Bits D07–D04: | Selects which PWM channel is output to SUB_PWM-            |
| Bits D03–D00: | Selects which PWM channel is output to SUB_PWM+            |
|               |  |

Note that channels are encoded so that channel 1 = 0x00, channel 2 = 0x01, ..., channel 6 = 0x05.

| D31   | D30                        | D29                                       | D28                                       | D27                             | D26                                  | D25                             | D24                                       | FUNCTION  |

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

#### LOUDNESS BIQUAD GAIN INVERSE REGISTER (0x26)

Bit D6 of the volume configuration register (0x0E) enables/disables gain compensation for BQ1. D6 = 0 disables gain compensation (default); D6 = 1 enables gain compensation. Max/min biquad gain =  $\pm 4$ .

#### Table 25. Loudness Biquad Gain Inverse Register (3.23 Format)

| CONTENT           | DEFINITION         |
|-------------------|--------------------|
| u[31:26], x[25:0] | 1/G <sup>(1)</sup> |

(1) G = gain of the biquad

#### LOUDNESS SCALE REGISTER (0x28)

TAS5706A is Not Recommended for New Designs

www.ti.com

SLOS606D-MARCH 2009-REVISED SEPTEMBER 2009

#### **TAS5706B SPECIFIC REGISTER SETTINGS:**

The TAS5706B is recommended for 2.1-mode operations. When used in the 2.1 mode, the following register settings are recommended for best performance:

#### Shutdown Group Register

#### Table 28. SHUTDOWN GROUP REGISTER (0x19) = 0x0C

| D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | FUNCTION                                     |
|----|----|----|----|----|----|----|----|--|
| 0  | _  | -  | -  | -  | _  | -  | _  | Reserved                                     |
| -  | 0  | -  | -  | -  | _  | -  | _  | Reserved                                     |
| -  | _  | 0  | -  | -  | _  | -  | _  | Channel 6 does not belong to shutdown group. |
| -  | -  | Ι  | 0  | -  | -  | -  | -  | Channel 5 does not belong to shutdown group. |
| -  | -  | Ι  | Ι  | 1  | -  | -  | -  | Channel 4 belong to shutdown group.          |
| -  | _  | -  | -  | -  | 1  | -  | _  | Channel 3 belong to shutdown group.          |
| _  | _  | _  | _  | -  | _  | 0  | _  | Channel 2 does not belong to shutdown group. |
| -  | _  | _  | _  | -  | _  | -  | 0  | Channel 1 does not belong to shutdown group. |

#### **START/STOP Register**

#### Table 29. Start/Stop Period Register (0x1A) = 0x95

| D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | FUNCTION                                  |
|----|----|----|----|----|----|----|----|---|
| 1  | -  | -  | ١  | -  | -  | -  | -  | Single-Ended Load (SE Mode)               |
| -  | 0  | 0  | ١  | -  | -  | -  | -  | RESERVED                                  |
| -  | -  | -  | 1  | 0  | 1  | 0  | 1  | 703.1-ms 50% duty cycle start/stop period |

#### Input Mux Register

This register controls the modulation scheme (AD or BD mode) as well as the routing of I2S audio to the internal channels

If used in 2.1 Mode (2SE + 1 BTL), the SE channels should be in AD Mode and BTL channels should be in BD Mode. Register 0X20 should be updated to reflect this setting as shown in Table 30:

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs. LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect. NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available. OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined. Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above. Green (ROHS & no Sh/Br): Ti defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Multiple Top-Side Markings will be inside parentheses. Only one Top-Side Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Top-Side Marking for that device.

PAP (S-PQFP-G64)

PowerPAD<sup>™</sup> PLASTIC QUAD FLATPACK

NOTES:

- A. All linear dimensions are in millimeters.B. This drawing is subject to change without notice.
- C. Body dimensions do not include mold flash or protrusion
- D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <a href="https://www.ti.com">http://www.ti.com</a>.

E. Falls within JEDEC MS-026

PowerPAD is a trademark of Texas Instruments.

# THERMAL PAD MECHANICAL DATA

# PAP (S-PQFP-G64)

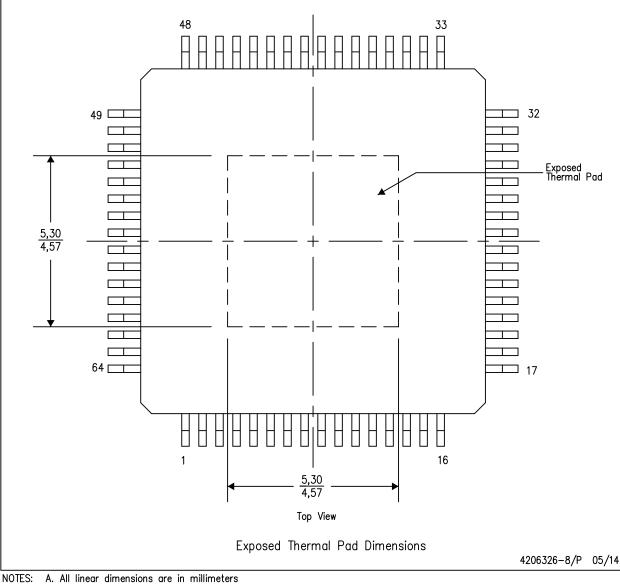

PowerPAD<sup>™</sup> PLASTIC QUAD FLATPACK

# THERMAL INFORMATION

This PowerPAD<sup>™</sup> package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

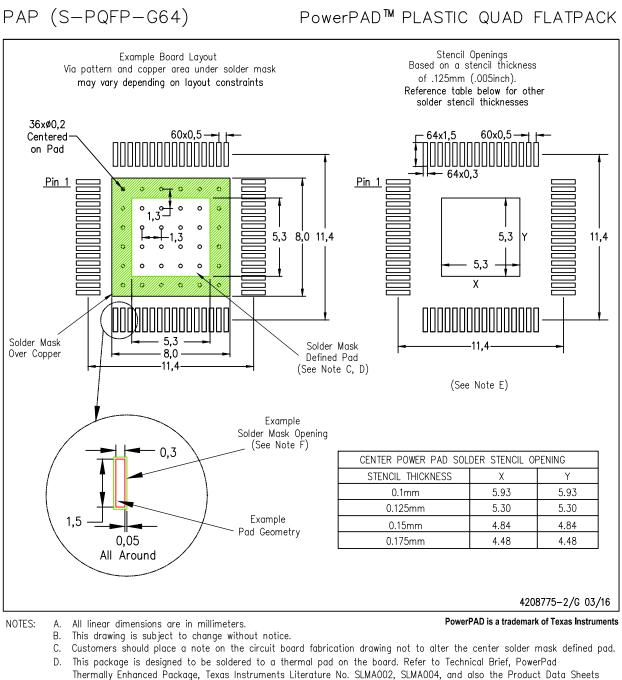

PowerPAD is a trademark of Texas Instruments

# LAND PATTERN DATA

- Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <a href="http://www.ti.com">http://www.ti.com</a>. Publication IPC-7351 is recommended for alternate designs.
- E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
- F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
