UC1846-SP

SLUS871C – JANUARY 2009 – REVISED OCTOBER 2015

UC1846-SP Rad-Tolerant Class-V, Current-Mode PWM Controller

1 Features

- QML-V Qualified, SMD 5962-8680603VxA ⁽¹⁾
 - Rad-Tolerant: 40 kRad (Si) TID
- Automatic Feed-Forward Compensation
- Programmable Pulse-by-Pulse Current Limiting
- Automatic Symmetry Correction in Push-Pull Configuration
- Enhanced Load Response Characteristics
- Parallel-Operation Capability for Modular Power Systems
- Differential Current-Sense Amplifier With Wide Common-Mode Range
- Double-Pulse Suppression
- 500-mA (Peak) Totem-Pole Outputs
- $\pm 1\%$ Bandgap Reference
- Undervoltage Lockout (UVLO)
- Soft-Start Capability
- Shutdown Terminal
- 500-kHz Operation

2 Applications

- DC-DC Converters
- Satellite Buses and Payloads
- Space Launch Vehicles
- Undersea Cabling
- Available in Military Temperature Range (-55°C to 125°C)
- Supports Various Topologies:
 - Flyback, Forward, Buck, Boost
 - Push-Pull, Half-Bridge, Full Bridge With External Interface Circuit

3 Description

The UC1846-SP control devices provide all of the necessary features to implement fixed frequency, current mode control schemes while maintaining a minimum external parts count. The superior performance of this technique can be measured in improved line regulation, enhanced load response characteristics, and a simpler, easier-to-design control loop. Topological advantages include inherent pulse-by-pulse current limiting capability, automatic symmetry correction for push-pull converters, and the ability to parallel *power modules* while maintaining equal current sharing.

Protection circuitry includes built-in UVLO and programmable current limit in addition to soft start capability. A shutdown function is also available which can initiate either a complete shutdown with automatic restart or latch the supply off.

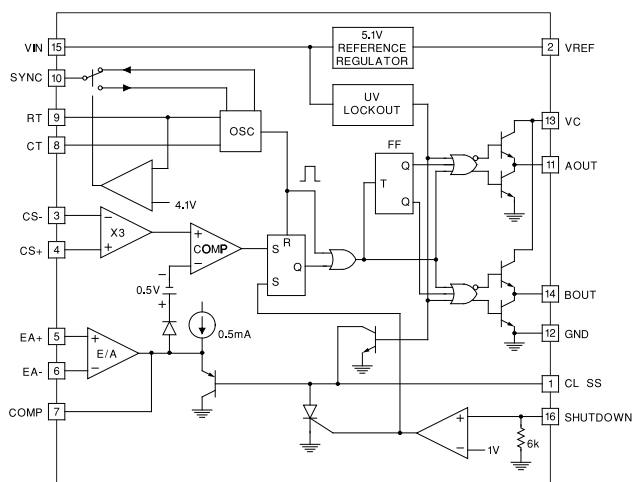

Other features include fully latched operation, double-pulse suppression, deadline adjust capability, a $\pm 1\%$ trimmed bandgap reference, and low outputs in the OFF state.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
UC1846-SP	CDIP (16)	6.92 mm \times 19.56 mm
	CFP (16)	6.73 mm \times 10.30 mm
	LCCC (20)	8.89 mm \times 8.89 mm
	KGD	N/A

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Block Diagram

(1) Radiation tolerance is a typical value based upon initial device qualification with dose rate = 10 mRad/s. Radiation Lot Acceptance Testing is available - contact factory for details.

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (October 2011) to Revision C

Page

• Updated from "30 kRad" to "40 kRAD"	1
• Added ESD Ratings table, Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section	1
• Added KGD package to Device Information	1

5 Pin Configuration and Functions

Pin Functions

PIN			I/O	DESCRIPTION
NAME	CDIP or CFP	LCCC		
CL SS	1	2	I	Current limit/Soft start
VREF	2	3	O	5.1-V internally generated reference
CS-	3	4	I	Inverting input of current sense operational amplifier
CS+	4	5	I	Non-Inverting input of current sense operational amplifier
EA+	5	7	I	Non-Inverting input of error amplifier
EA-	6	8	I	Inverting input of error amplifier
COMP	7	9	O	Output of error amplifier
CT	8	10	I	Timing capacitance. Capacitor connected from CT to ground is charged via current established by RT pin via current mirror. Output Pulse dead time is determined by the size of the capacitor during capacitor discharge time.
RT	9	12	I	Determines oscillator frequency. VREF sources thru RT to create a current which is mirrored to CT pin.
SYNC	10	13	I/O	Sync pin is an output under normal operation when RT is above 4.1-V Sync output high. Sync pin is an input when RT pin is high and CT pin tied low.
AOUT	11	14	O	Output driver (source/sink)
GND	12	15	—	Ground connection
VC	13	17	I	Gate drive collector supply voltage. Decouple with capacitor.
BOUT	14	18	O	Output driver (source/sink)
VIN	15	19	I	Input voltage decouple with capacitor
SHUTDOWN	16	20	I	Shutdown threshold 1 V. Voltage above threshold latches off oscillator.
NC	—	1, 6, 11	—	No connect

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
V _{CC}	Supply voltage		40	V
	Collector supply voltage		40	V
V _I	Analog input voltage (C/S-, C/S+, E/A+, E/A-, Shutdown)	–0.3	V _{IN}	V
I _O	Output current, source or sink		500	mA
	Reference output current		–30	mA
	Sync output current		–5	mA
	Error amplifier output current		–5	mA
	Soft-start sink current		50	mA
	Oscillator charging current		5	mA
T _{J(max)}	Maximum junction temperature		150	°C
T _{lead}	Lead temperature (soldering, 10 s)		300	°C
T _{stg}	Storage temperature	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to ground. Currents are positive into, negative out of the specified terminal.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T _J	Operating junction temperature	–55		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		UC1846-SP			UNIT
		J (CDIP)	W (CFP)	FK (LCCC)

6.6 Typical Characteristics

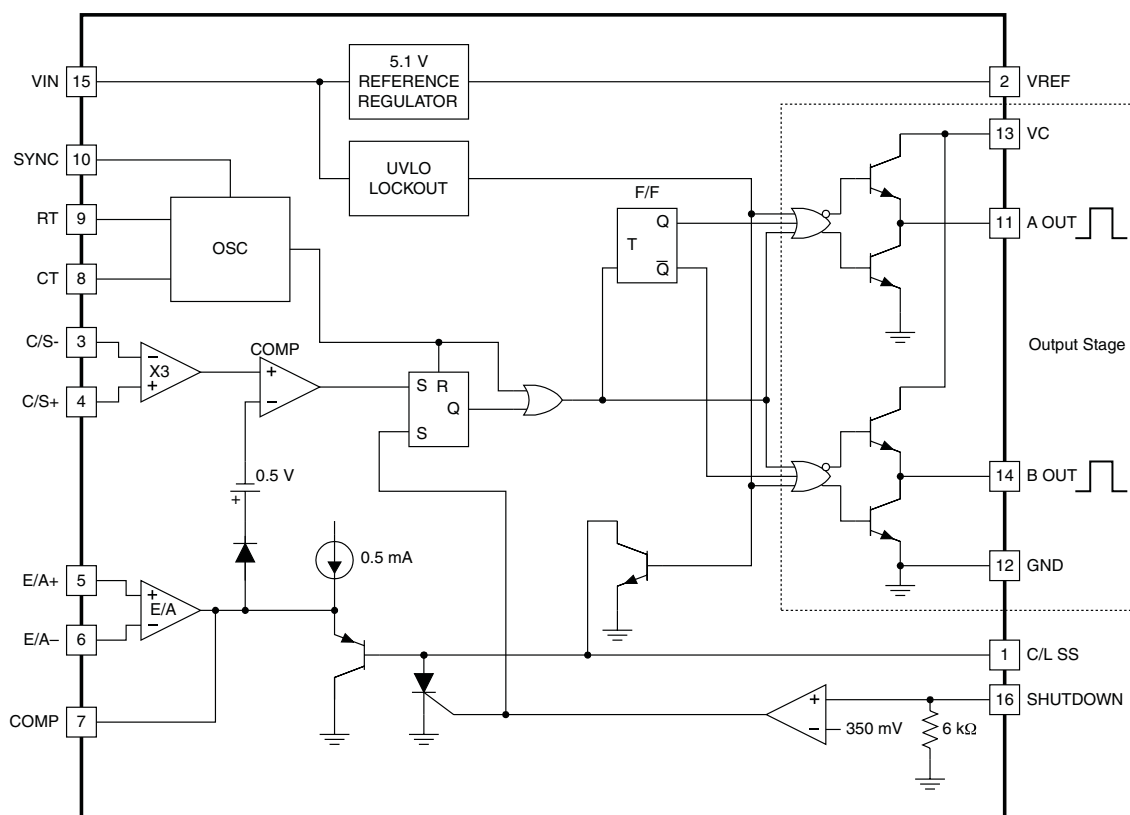

7 Detailed Description

7.1 Overview

The UC1846-SP control devices provide all of the necessary features to implement fixed frequency, current mode control schemes while maintaining a minimum external parts count. The superior performance of this technique can be measured in improved line regulation, enhanced load response characteristics, and a simpler, easier-to-design control loop. Topological advantages include inherent pulse-by-pulse current limiting capability, automatic symmetry correction for push-pull converters, and the ability to parallel "power modules" while maintaining equal current sharing.

7.2 Functional Block Diagram

NOTE: Pin numbers shown are for the J package.

7.3 Feature Description

UC1846-SP is a current mode controller, used to support various topologies such as forward, flyback, half-bridge, full bridge, push-pull configurations.

Current mode control is a two-loop system. The switching power supply inductor is hidden within the inner current control loop. This simplifies the design of the outer voltage control loop and improves power supply performance in many ways, including better dynamics. The objective of this inner loop is to control the state-space averaged inductor current, but in practice the instantaneous peak inductor current is the basis for control (switch current - equal to inductor current during the on time - is often sensed). If the inductor ripple current is small, peak inductor current control is nearly equivalent to average inductor current control.

UC1846-SP

SLUS871C – JANUARY 2009 – REVISED OCTOBER 2015

www.ti.com

Feature Description (continued)

The peak method of inductor current control functions by comparing the upslope of inductor current (or switch current) to a current program level set by the outer loop. The comparator turns the power switch off when the instantaneous current reaches the desired level. The current ramp is usually quite small compared to the programming level, especially when V_{IN} is low. As a result, this method is extremely susceptible to noise. A noise spike is generated each time the switch turns on. A fraction of a volt coupled into the control circuit can cause it to turn off immediately, resulting in a sub-harmonic operating mode with much greater ripple. Circuit layout and bypassing are critically important to successful operation.

The peak current mode control method is inherently unstable at duty ratios exceeding 0.5, resulting in sub-harmonic oscillation. A compensating ramp (with slope equal to the inductor current downslope) is usually applied to the comparator input to eliminate this instability. A slope compensation must be added to the sensed current waveform or subtracted from the control voltage to ensure stability above a 50% duty cycle. A compensating ramp (with slope equal to the inductor current downslope) is usually applied to the comparator input to eliminate this instability.

The pulse width modulator (PWM) of UC1846-SP is limited to a maximum duty cycle of 50%, thus it can be used in topologies such as push-pull, half bridge, full bridge, forward, flyback configurations. Limiting PWM to 50% duty cycle ensures that for isolated or transformer based topologies. The transformer is allowed to reset and prevent saturation of the transformer core.

Pulse-by-pulse symmetry correction (flux balancing) is inherent to current mode controllers and essential for the push-pull topology to prevent core saturation.

Current limit control design has numerous advantages:

1. Current mode control provided peak switch current limiting – pulse by pulse current limit.
2. Control loop is simplified as one pole due to output inductor is pushed to higher frequency, thus a two pole system turns into two real poles. Thus system reduces to a first order system thus simplifies the control.
3. Multiple converter can be paralleled and allows equal current sharing amount the various converters.
4. Inherently provides for input voltage feed-forward as any perturbation in the input voltage will be reflected in the switch or inductor current. Since switch or inductor current is a direct control input, thus this perturbation is very rapidly corrected.
5. The error amplifier output (outer control loop) defines the level at which the primary current (inner loop) will regulate the pulse width, and output voltage.

Figure 3. Push-Pull Converter Using Current Mode Control

7.3.1 Reference

As highlighted in the [Functional Block Diagram](#), UC1846-SP incorporates a 5.1-V internal reference regulator with $\pm 10\%$ set point variation over temperature.

Feature Description (continued)

7.3.2 Oscillator

Figure 8 highlights the oscillator circuit. Connecting a resistor R_T from pin 9 to ground establishes a current, which is mirrored to pin 8 and charges the capacitor connected from pin 8 to ground. Maximum on-time corresponds to the maximum charging time of the timing capacitor. Oscillator frequency can be determined by Equation 5.

Off-time corresponds to capacitor discharge time establishes the converter dead time between the pulses according to Equation 4. Internal 8-mA current sink discharges the CT pin capacitor.

7.3.3 Slope Compensation

For duty cycle above 50% slope compensating can be implemented by using a buffer (that is, 2N2222) and connecting base to timing capacitor pin 8, collector to VREF (5 V), a resistor in series with emitter connected to (pin 4) CS+ of differential current sense amplifier. Injecting a downslope proportional to the sawtooth into current sense amplifier.

As with any bipolar PWM IC, outputs should be protected from negatively biasing the substrate. This is typically done by using Schottky diodes from ground to each output. Failure to do this could cause spurious interruption and restart of the oscillator, dropping of output pulses and a significant increase in propagation delays.

7.3.4 Error Amplifier

UC1846-SP incorporates an error amplifier with typical open loop gain of 100 db and gain bandwidth of 1.5 MHz. With Source and sink capability of 10 mA and 0.5 mA respectively.

Error amplifier sources up to 0.5 mA.

Figure 4. Error Amplifier Output Configuration

7.3.5 Current Sense Amplifier

UC1846-SP incorporates a differential current sense amplifier which can eliminate ground loop problems and increase noise immunity. An R-C snubber can also be implemented thus helping in blanking the peak current spike when the switch is turned on. The input of the current sense amplifier is slew rate limited allowing lower values of filter capacitors to be used to eliminate leading edge noise.

A small RC filter may be required in some applications to reduce switch transients. Differential input allows remote, noise-free sensing.

Figure 5. Current-Sense Amplifier Connections

UC1846-SP

SLUS871C – JANUARY 2009 – REVISED OCTOBER 2015

www.ti.com

Feature Description (continued)

In some applications, a small RC filter is required to reduce switch transients. Differential input allows remote noise sensing.

7.3.6 Current Limit

Over current trip point is determined by Equation 1. Differential current sense amplifier has a gain of three, as shown in Figure 6.

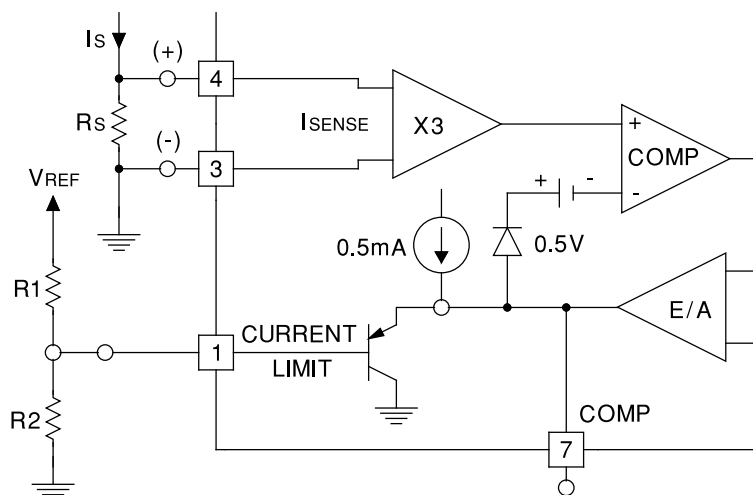

Figure 6. Pulse-By-Pulse Current Limiting

Referring to Figure 6, Equation 1 determines the peak current, I_s .

$$I_s = \frac{\left(\frac{R_2 V_{REF}}{R_1 + R_2} \right) - 0.5}{3R_s} \quad (1)$$

7.3.7 Shutdown

UC1846-SP incorporates a shutdown pin (pin16). Shutdown threshold voltage is 1 V. Exceeding the shutdown threshold voltage causes the device to shutdown.

- If current into ICL_SS $V_{REF}/R_1 > 3\text{-mA}$ SCR holding current (minimum latch current), then the device latches off. Power recycle is required to un-latch the device.
- If $V_{REF}/R_1 < 0.8\text{ mA}$, that is $ICL_SS < 0.8\text{ A}$, then this ensures that the circuit does not latch in a shutdown state.

Feature Description (continued)

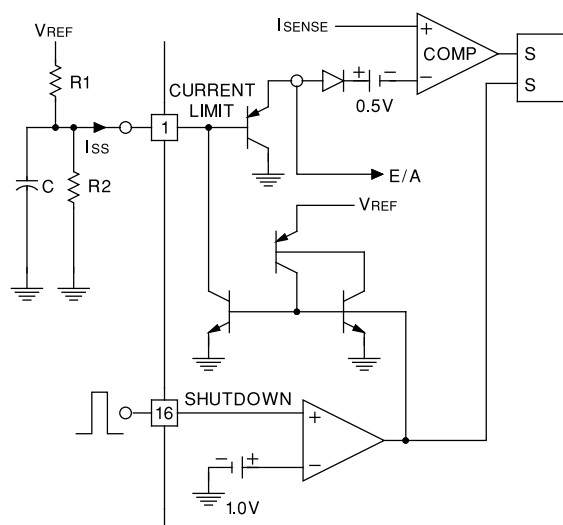

Figure 7. Shutdown Latch

Referring to [Figure 11](#), if

$$\frac{V_{REF}}{R1} < 0.8\text{mA} \quad (2)$$

the shutdown latch commutates when $I_{SS} = 0.8\text{ mA}$ and a restart cycle initiates.

Referring to [Figure 12](#), if

$$\frac{V_{REF}}{R1} > 3\text{mA} \quad (3)$$

the device latches off until power is recycled.

7.3.8 Output Section

UC1846-SP incorporates high current dual totem pole output stage capable of sourcing/sinking 1.5 A peak current for fast switching of power MOSFETs and limited to 0.5 A dc current.

7.3.9 Undervoltage Lockout

Minimum input voltage for converter is 8 V or higher, with typical value being 7.7 V. At input voltages below the actual UVLO voltage, the devices will not operate.

7.3.10 Soft-Start

Connecting a capacitor from CL/SS pin 1 to ground which is charged by 0.5-mA internal current source will determine the soft-start time. If over current is also implemented as shown in [Figure 6](#), then SS charge time will be determined by charging SS capacitor by 0.5-mA current as well as current contributed by R1 resistor in charging the SS capacitor.

7.4 Device Functional Modes

7.4.1 Operation With $V_{IN} < 8\text{ V}$ (Minimum V_{IN})

The devices operate with input voltages above 8 V. The maximum UVLO voltage is 8 V and will operate at input voltages above 8 V. The typical UVLO voltage is 7.7 V and the devices may operate at input voltages above that point. The devices also may operate at lower input voltages, the minimum UVLO voltage is not specified. At input voltages below the actual UVLO voltage, the devices will not operate.

UC1846-SP

SLUS871C – JANUARY 2009 – REVISED OCTOBER 2015

www.ti.com**Device Functional Modes (continued)****7.4.2 Synchronization**

The synchronization pin (pin10) can be configured as an output for master/slave application. When the converter is configured as a master or standalone converter, SYNC (pin 10) is an output. As highlighted in the functional block diagram, voltage at RT (pin 9) is greater than 4.1-V internal threshold.

When using the part in slave configuration, SYNC pin becomes an input. Typical example of parallel operation with master/slave configuration is shown in [Figure 13](#). Slave unit CT (pin 8) is grounded and RT pin is connected to VREF (pin 2).

When using the part in slave configuration, SYNC pin becomes an input. Typical example of parallel operation with master/slave configuration is shown in [Figure 13](#). Slave unit CT (pin 8) is grounded and RT pin is connected to VREF (pin 2). Under parallel configuration two or more units can be paralleled, with COMP pins tied together each will share current equally.

7.4.3 Parallel Operation

Under parallel configuration two or more units can be paralleled, with COMP pins tied together each will share current equally.

[Figure 13](#) highlights typical parallel operation configuration.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

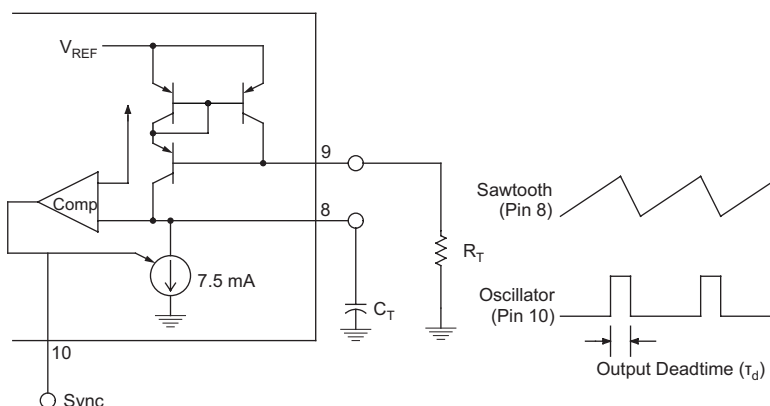

8.1 Application Information

UC1846-SP can be used as a controller to design various topologies such as push-pull, half-bridge, full bridge, and flyback.

The following sections highlight the topologies for oscillators, error amplifiers, and parallel configurations (paralleling two EVMs).

8.2 Typical Applications

8.2.1 Oscillator Circuit Application

- A. Output deadtime is determined by the external capacitor, C_T , according to the formula:

$$\tau_d (\mu s) = 145 C_T (\mu F) \frac{I_D}{I_D - \frac{3.6}{R_T (k\Omega)}} \quad (4)$$

- B. I_D = Oscillator discharge current at 25°C is typically 7.5.

- C. For large values of τ_d (μs) = $145 C_T (\mu F)$

- D. Oscillator frequency is approximated by the formula:

$$f_T (kHz) \approx \frac{2.2}{R_T (k\Omega) \times C_T (\mu F)} \quad (5)$$

Figure 8. Oscillator Circuit

8.2.1.1 Design Requirements

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE	REFERENCE
Oscillator frequency = 200 kHz	$R_T = 10 \text{ k}\Omega$, $C_T = 1 \text{ nF}$	Equation 4, Figure 8
Dead time, $T_d = 75.8 \text{ ns}$	$R_T = 10 \text{ k}\Omega$, $C_T = 1 \text{ nF}$	Equation 5, Figure 8

8.2.1.2 Detailed Design Procedure
8.2.1.2.1 Input Capacitor Selection

Load current, duty cycle, and switching frequency are several factors which determine the magnitude of the input ripple voltage. Without the input capacitor, the pulsating current of Q1 would need to be completely supplied by the host source, VIN, which commonly does not have sufficiently low output impedance. Thus there would be substantial noise on the host dc voltage source and an increase in the conducted EMI on the board. The input capacitor, CIN, effectively filters the input current so the current from the host dc source is approximately an average current.

The input ripple voltage amplitude is directly proportional to the output load current. The maximum input ripple amplitude occurs at maximum output load. Also, the amplitude of the voltage ripple varies with the duty cycle of the converter.

UC1846-SP requires a high quality ceramic, type X5R or X7R, input decoupling capacitor of at least 47 µF of effective capacitance on the VIN input voltage pins. In some applications additional bulk capacitance may also be required for the VIN input. The effective capacitance includes any DC bias effects. The voltage rating of the input capacitor must be greater than the maximum input voltage. The capacitor must also have a ripple current rating greater than the maximum input current ripple of the UC1846-SP. The input ripple current can be calculated using [Equation 6](#).

$$I_{cirms} = I_{out} \times \sqrt{\frac{V_{out}}{V_{inmin}} \times \frac{(V_{inmin} - V_{out})}{V_{inmin}}} \quad (6)$$

The value of a ceramic capacitor varies significantly over temperature and the amount of DC bias applied to the capacitor. The capacitance variations due to temperature can be minimized by selecting a dielectric material that is stable over temperature. X5R and X7R ceramic dielectrics are usually selected for power regulator capacitors because they have a high capacitance to volume ratio and are fairly stable over temperature. The output capacitor must also be selected with the DC bias taken into account. The capacitance value of a capacitor decreases as the DC bias across a capacitor increases.

The input capacitance value determines the input ripple voltage of the regulator. The input voltage ripple can be calculated using [Equation 7](#).

$$\Delta V_{in} = \frac{I_{outmax} \times 0.25}{C_{in} \times f_{sw}} \quad (7)$$

8.2.1.2.2 Output Capacitor Selection

The output capacitance of a switching regulator is a vital part of the overall feedback system. The energy storage inductor and the output capacitor form a second-order low-pass filter.

In switching power supply power stages, the function of output capacitance is to store energy. The energy is stored in the capacitor's electric field due to the voltage applied. Thus, qualitatively, the function of a capacitor is to attempt to maintain a constant voltage.

The value of output capacitance of a buck power stage is generally selected to limit output voltage ripple to the level required by the specification. Since the ripple current in the output inductor is usually already determined, the series impedance of the capacitor primarily determines the output voltage ripple. The three elements of the capacitor that contribute to its impedance (and output voltage ripple) are equivalent series resistance (ESR), equivalent series inductance (ESL), and capacitance (C). The following gives guidelines for output capacitor selection.

For continuous inductor current mode operation, to determine the amount of capacitance needed as a function of inductor current ripple, ΔI_L , switching frequency, f_s , and desired output voltage ripple, ΔV_O , [Equation 8](#) is used assuming all the output voltage ripple is due to the capacitor's capacitance.

$$C \geq \frac{\Delta I_L}{8 \times f_s \times \Delta V_O}$$

where ΔI_L is the inductor ripple current.

$$\bullet \quad (8)$$

Each capacitor type is characterized by its impedance and the frequency range over which it is most effective. The frequency at which the impedance reaches its minimum is determined by its ESR and ESL. It is known as the self resonant frequency of the capacitor. The self resonant frequency is considered to be the maximum usable frequency for a capacitor. Above this frequency the impedance of the capacitor begins to rise as the ESL of the capacitor begins to dominate. Note that each capacitor type has a specific frequency band over which it is most effective. Therefore, a capacitor network of multiple capacitor types is more effective in reducing impedance than just one type.

The current slew rate of a regulator is limited by its output filter inductor. When the amount of current required by the load changes, the initial current deficit must be supplied by the output capacitors until the regulator can meet the load demand.

The desired response to a large change in the load current is the first criteria. The output capacitor needs to supply the load with current when the regulator control loop can not supply the current. This happens when Load (ie: memory, processor) has a large and fast increase in current, such as a transition from no load to full load. The regulator typically needs two or more clock cycles for the control loop to see the change in load current, output voltage and adjust the duty cycle to react to the change. The output capacitor must be properly sized to supply the extra current to the Load until the control loop responds to the Load change. The output capacitance must be large enough to supply the difference in current for 2 clock cycles while only allowing a tolerable amount of droop in the output voltage. Equation 9 shows the minimum output capacitance necessary to accomplish this.

$$C_o > \frac{2 \times \Delta I_{out}}{f_{sw} \times \Delta V_{out}} \quad (9)$$

Where ΔI_{out} is the change in output current, f_{sw} is the regulators switching frequency and ΔV_{out} is the allowable change in the output voltage. For this example, the transient load response is specified as a 5% change in V_{out} for a load step of 1A. For this example, $\Delta I_{out} = 1.0$ A and $\Delta V_{out} = 0.05 \times 3.3 = 0.165$ V. Using these numbers gives a minimum capacitance of 25 μ F. This value does not take the ESR of the output capacitor into account in the output voltage change. For ceramic capacitors, the ESR is usually small enough to ignore in this calculation.

8.2.1.2.3 Output Inductor Selection

To calculate the value of the output inductor, use Equation 10. Kind is a coefficient that represents the amount of inductor ripple current relative to the maximum output current. The inductor ripple current is filtered by the output capacitor. Therefore, choosing high inductor ripple currents impact the selection of the output capacitor since the output capacitor must have a ripple current rating equal to or greater than the inductor ripple current. In general, the inductor ripple value is at the discretion of the designer; however, Kind is normally from 0.1 to 0.3 for the majority of applications. VinLC refers to the voltage at the input of output LC filter.

$$L_1 = \frac{V_{inLC} - V_{out}}{I_o \times Kind} \times \frac{V_{out}}{V_{inLC} \times f_{sw}} \quad (10)$$

The current flowing through the inductor is the inductor ripple current plus the output current. During power up, faults or transient load conditions, the inductor current can increase above the calculated peak inductor current level calculated above. In transient conditions, the inductor current can increase up to the switch current limit of the device. For this reason, the most conservative approach is to specify an inductor with a saturation current rating equal to or greater than the switch current limit rather than the peak inductor current.

8.2.1.2.4 Switching Frequency

Initial accuracy of UC1846-SP oscillator frequency is 200 kHz \pm 15% over the temperature range. Switching frequency selection is a trade-off between the overall design size and efficiency. Operating at lower switching frequency will result in higher efficiency at the expense of larger solution footprint.

Oscillator frequency can be determined as follows:

$$R_T = 10 \text{ k}\Omega \quad (11)$$

$$C_T = 1 \text{ nF} \quad (12)$$

$$f_T = \frac{2}{R_T \times C_T} \quad (13)$$

$$f_T = 200 \text{ kHz} \quad (14)$$

9 Power Supply Recommendations

The devices are designed to operate from an input voltage supply range between 8 and 40 V. This input supply should be well regulated. If the input supply is located more than a few inches from the UC1846-SP converter additional bulk capacitance may be required in addition to the ceramic bypass capacitors. A tantalum capacitor with a value of 47 μF is a typical choice, however this may vary depending upon the output power being delivered.

10 Layout

10.1 Layout Guidelines

Always try to use a low EMI inductor with a ferrite type closed core. Some examples would be toroid and encased E core inductors. Open core can be used if they have low EMI characteristics and are located a bit more away from the low power traces and components. Make the poles perpendicular to the PCB as well if using an open core. Stick cores usually emit the most unwanted noise.

Each output driver of these devices is capable of 2-A peak currents. Careful layout is essential for correct operation of the chip. A ground plane must be employed. A unique section of the ground plane must be designated for high di/dt currents associated with the output stages. Power ground can be separated from the rest of the ground plane and connected at a single point, although this is not necessary if the high di/dt paths are well understood and accounted for. VIN should be bypassed directly to power ground with a good high frequency capacitor. The sources of the power MOSFET should connect to power ground as should the return connection for input power to the system and the bulk input capacitor. The output should be clamped with a high current Schottky diode to both VIN and GND. Nothing else should be connected to power ground.

VREF should be bypassed directly to the signal portion of the ground plane with a good high frequency capacitor. Low ESR/ESL ceramic 1- μF capacitors are recommended for both VIN and VREF. All analog circuitry should likewise be bypassed to the signal ground plane.

10.2 Layout Example

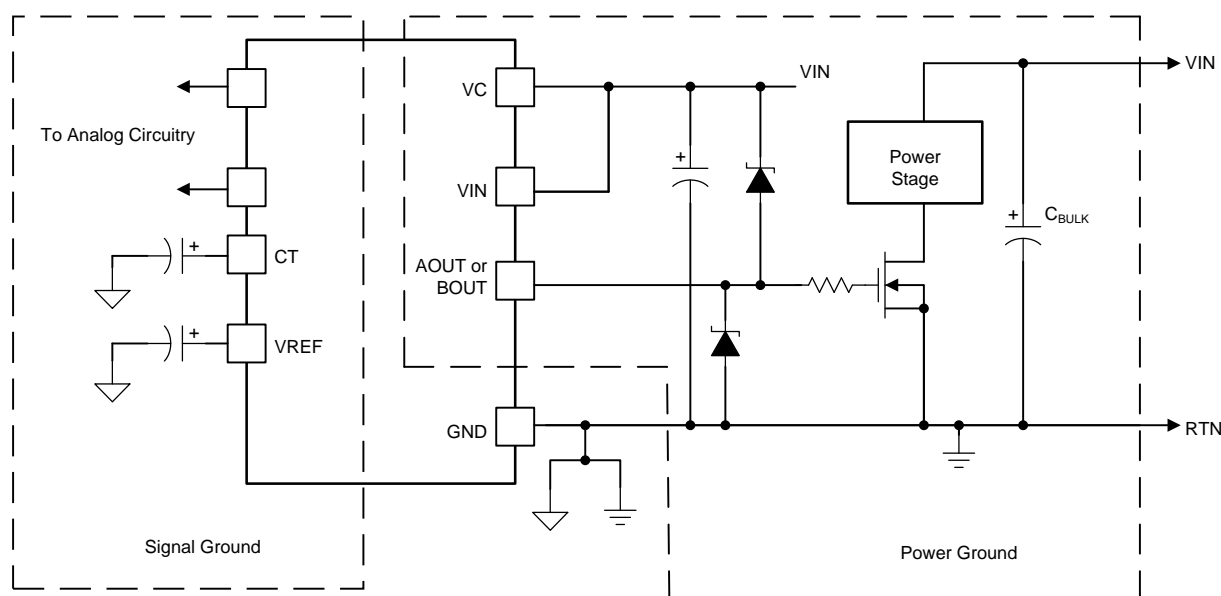

Figure 16. Layout Recommendation

11 Device and Documentation Support

11.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.2 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
