## LED Flash Driver

Charge Pump with 1000mA Flash Mode,  
275mA Spotlight Mode, and I<sup>2</sup>C Interface

### POWER MANAGEMENT

#### Features

- Input supply voltage range — 3.0V to 5.5V
- Charge pump modes — 1x, 1.5x and 2x
- Flash LED — 1000mA max in flash mode, 275mA max continuous for spotlight
- Charge pump frequency — 250kHz
- I<sup>2</sup>C compatible interface — up to 400kHz
- External flash control pin to sync with camera
- One second flash time out with disable feature
- Automatic sleep mode (flash off) — I<sub>Q</sub> = 100μA
- Low shutdown current — 0.1μA (typical)
- Ultra-thin package — 3mm x 3mm x 0.6mm
- Fully WEEE and RoHS compliant

#### Applications

- Cellular phone flash
- PDA flash

#### Description

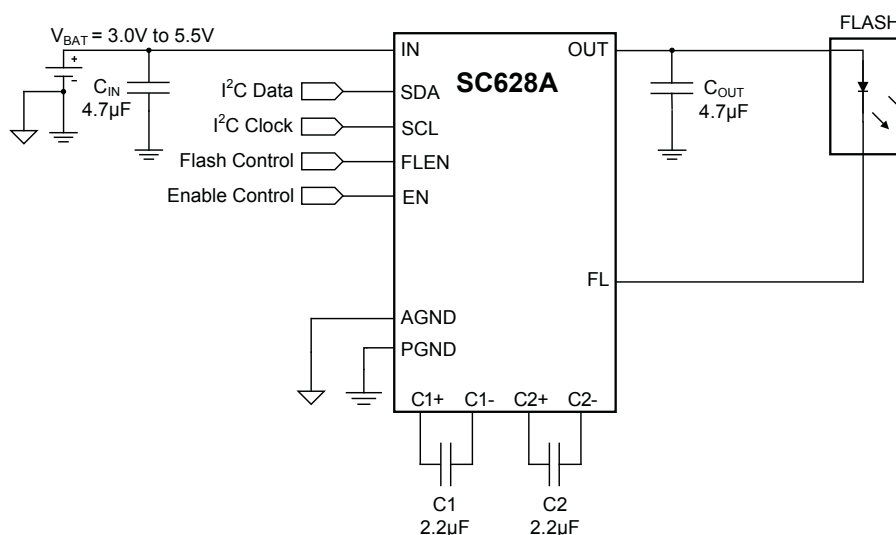

The SC628A is a high efficiency charge pump LED driver using Semtech's proprietary charge pump technology. Performance is optimized for use in single-cell Li-ion battery applications. The load and supply conditions determine whether the charge pump operates in 1x, 1.5x, or 2x mode.

The charge pump provides continuous spotlight mode current or pulsed flash mode current to an LED using a dedicated current sink. In flash mode, a flash-timeout feature turns off the flash if active for longer than 1 second. In spotlight mode, the timeout feature is disabled to allow continuous operation of the LED.

The SC628A uses an I<sup>2</sup>C compatible serial interface to set the flash mode or the spotlight mode current. The flash/spotlight output is triggered via either the I<sup>2</sup>C interface or a dedicated flash enable pin (FLEN).

In sleep mode, the device reduces quiescent current to 100μA while continuing to monitor the serial interface. Total current reduces to 0.1μA in shutdown.

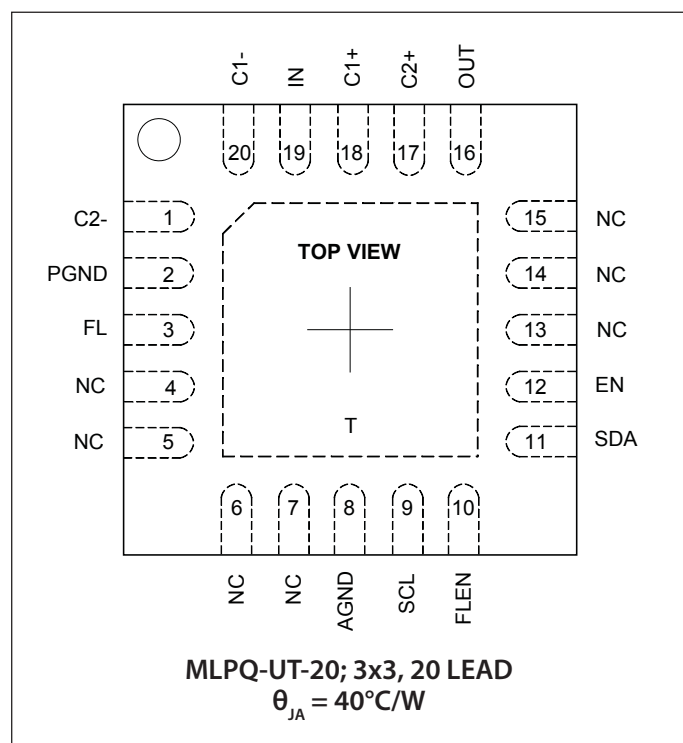

### Typical Application Circuit

US Patents: 6,504,422; 6,794,926

## Pin Configuration

## Ordering Information

Device	Package
SC628AULTRT <sup>(1)(2)</sup>	MLPQ-UT-20 3x3
SC628AEVB	Evaluation Board

### Notes:

- (1) Available in tape and reel only. A reel contains 3,000 devices.
- (2) Lead-free package only. Device is WEEE and RoHS compliant.

## Marking Information

## Absolute Maximum Ratings

IN (V)	-0.3 to +6.0
OUT (V)	-0.3 to +6.0
C1+, C2+ (V)	-0.3 to ( $V_{OUT} + 0.3$ )
Pin Voltage - All Other Pins (V)	-0.3 to ( $V_{IN} + 0.3$ )
OUT Short Circuit Duration	Continuous
ESD Protection Level <sup>(1)</sup> (kV)	2

## Recommended Operating Conditions

Ambient Temperature Range (°C)	$-40 \leq T_A \leq +85$
IN (V)	$3.0 \leq V_{IN} \leq 5.5$
OUT (V)	$2.5 \leq V_{OUT} \leq 5.25$

## Thermal Information

Thermal Resistance, Junction to Ambient <sup>(2)</sup> (°C/W)	40
Maximum Junction Temperature (°C)	+150
Storage Temperature Range (°C)	-65 to +150
Peak IR Reflow Temperature (10s to 30s) (°C)	+260

Exceeding the above specifications may result in permanent damage to the device or device malfunction. Operation outside of the parameters specified in the Electrical Characteristics section is not recommended.

### NOTES:

- (1) Tested according to JEDEC standard JESD22-A114-B.
- (2) Calculated from package in still air, mounted to 3" x 4.5", 4 layer FR4 PCB with thermal vias under the exposed pad per JESD51 standards.

## Electrical Characteristics

Unless otherwise noted,  $T_A = +25^\circ\text{C}$  for Typ,  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$  for Min and Max,  $T_{J(\text{MAX})} = 125^\circ\text{C}$ ,  $V_{IN} = 3.0\text{V}$  to  $4.2\text{V}$ ,  $C_{IN} = C_{OUT} = 4.7\mu\text{F}$  (ESR =  $0.03\Omega$ ),  $C_1 = C_2 = 2.2\mu\text{F}$  (ESR =  $0.03\Omega$ ), size code 0603 (1608 metric) for all capacitors

Parameter	Symbol	Conditions	Min	Typ	Max	Units
Supply Specifications						
Shutdown Current	I <sub>Q(OFF)</sub>	Shutdown, V <sub>IN</sub> = 4.2V		0.1	2	μA

## Pin Descriptions

Pin #	Pin Name	Pin Function
1	C2-	Negative connection to bucket capacitor 2 — requires a 2.2μF capacitor connected to C2+
2	PGND	Ground pin for high current charge pump and Flash LED driver
3	FL	Current sink output for flash LED(s)
4	NC	Unused pin — do not terminate
5	NC	Unused pin — do not terminate
6	NC	Unused pin — do not terminate
7	NC	Unused pin — do not terminate
8	AGND	Analog ground pin — connect to ground and separate from PGND current
9	SCL	I <sup>2</sup> C clock input pin
10	FLEN	Control pin for flash LED(s) — high = ON, low = OFF
11	SDA	I <sup>2</sup> C bi-directional data pin — used for read and write operations for all internal registers (refer to Register Map and I <sup>2</sup> C Interface sections)
12	EN	Chip enable — active high — low state resets all registers (see register map table)
13	NC	Unused pin — do not terminate
14	NC	Unused pin — do not terminate
15	NC	Unused pin — do not terminate
16	OUT	Charge pump output — all LED anode pins should be connected to this pin — requires a 4.7μF capacitor to PGND
17	C2+	Positive connection to bucket capacitor 2 — requires a 2.2μF capacitor connected to C2-
18	C1+	Positive connection to bucket capacitor 1 — requires a 2.2μF capacitor connected to C1-
19	IN	Battery voltage input — connect with a 4.7μF capacitor to PGND
20	C1-	Negative connection to bucket capacitor 1 — requires a 2.2μF capacitor connected to C1+
T	THERMAL PAD	Thermal pad for heatsinking purposes — connect to ground plane using multiple vias — not connected internally

## Block Diagram

## Applications Information

### General Description

This design is optimized for handheld applications supplied from a single Li-Ion cell and includes the following key features:

- A high efficiency fractional charge pump that supplies power to the flash LED
- An LED flash output that provides up to 1000mA of momentary current or up to 275mA of continuous spotlight current
- An I<sup>2</sup>C compatible interface that provides control of all device functions

### High Current Fractional Charge Pump

The flash output is supported by a high efficiency, high current fractional charge pump output at the OUT pin. The charge pump multiplies the input voltage by 1, 1.5, or 2 times. The charge pump switches at a fixed frequency of 250kHz in 1.5x and 2x modes and is disabled in 1x mode to save power and improve efficiency.

The mode selection circuit automatically selects the 1x, 1.5x or 2x mode based on circuit conditions. Circuit conditions such as low input voltage, high output current, or high LED voltage place a higher demand on the charge pump output. A higher numerical mode may be needed momentarily to maintain regulation at the OUT pin during intervals of high demand, such as the high current of an LED flash or the droop at the IN pin during a supply voltage transient. The charge pump responds to these momentary high demands, setting the charge pump to the optimum mode (1x, 1.5x or 2x), as needed to deliver the output voltage and load current while optimizing efficiency. Hysteresis is provided to prevent mode toggling.

The charge pump requires two bucket capacitors for low ripple operation. One capacitor must be connected between the C1+ and C1- pins and the other must be connected between the C2+ and C2- pins as shown in the typical application circuit diagram. These capacitors should be equal in value, with a minimum capacitance of 2.2μF to support the charge pump current requirements.

The device also requires a 4.7μF capacitor on the IN pin and a 4.7μF capacitor on the OUT pin to minimize noise and support the output drive requirements. Capacitor case size is an important factor in the performance of the SC628A. Due to the poor DC coefficient of the 0402 size (1005 metric), 0603 size (1608 metric) capacitors are strongly recommended to achieve the rated electrical specifications and performance shown in the typical characteristics section.

Capacitors with X7R or X5R ceramic dielectric are strongly recommended for their low ESR and superior temperature and voltage characteristics. Y5V capacitors should not be used as their temperature coefficients make them unsuitable for this application.

### LED Flash and Spotlight Current Sink

A single output current sink is provided to drive both flash and spotlight functions. In flash mode, this current sink provides up to 1000mA for a flash LED or array of parallel LEDs. Flash current settings are available in 21 values from 300mA to 1000mA. Flash steps increments are no larger than 75mA nominally. Some additional settings that have smaller increments of 50mA, 25mA and 12.5mA. Table 1 on page 12 contains detailed current setting information for flash mode. The FLEN pin directly triggers the FLASH function when pulled high, or it can be wired to IN to enable software control via the serial interface.

In spotlight mode, the output can be set for up to 275mA of continuous current. Settings are available in 25mA increments from 25mA to 275mA, with some additional settings that have smaller increments of 12.5mA. Table 2 on page 13 contains detailed current setting information for spotlight mode. Continuous operation above 275mA is not recommended due to high power dissipation.

### Flash and Spotlight Safety Timer

A safety timer disables the flash and spotlight output current sink if the sink remains active for an extended period. The timer protects the SC628A and the LED from high power dissipation that can cause overheating. The

## Applications Information (continued)

timer's default state is on, but the timer may be disabled via the serial interface to allow continuous output current in spotlight mode. The safety timer affects only the FL pin and will turn off the sink after a period of 1 second. The timer may be reset by either forcing the FLEN pin low or by resetting the Flash/Spotlight control bits via the interface.

### Shutdown State

The device is disabled when the EN pin is low. All registers are reset to default condition when EN is low.

### Sleep Mode

When the LED is off, sleep mode is activated. This is a reduced current mode that helps minimize overall current consumption by turning off the clock and the charge pump while continuing to monitor the serial interface for commands.

### I<sup>2</sup>C Compatible Interface Functions

All device functions can be controlled via the I<sup>2</sup>C compatible interface. The interface is described in detail in the Serial Interface section of the datasheet.

### Protection Features

The SC628A provides several protection features to safeguard the device from catastrophic failures. These features include:

- Output Open Circuit Protection
- Over-Temperature Protection
- Charge Pump Output Current Limit
- LED Float Detection

### Output Open Circuit Protection

Over-Voltage Protection (OVP) is provided at the OUT pin to prevent the charge pump from producing an excessively high output voltage. In the event of an open circuit at OUT, the charge pump runs in open loop and the voltage rises up to the OVP limit. OVP operation is hysteretic, meaning the charge pump will momentarily turn off until  $V_{OUT}$  is sufficiently reduced. The maximum OVP threshold is 6.0V, allowing the use of a ceramic output capacitor rated at 6.3V with no fear of over-voltage damage.

### Over-Temperature Protection

The Over-Temperature (OT) protection circuit helps prevent the device from overheating and experiencing a catastrophic failure. When the junction temperature exceeds 160°C, the device goes into thermal shutdown with all outputs disabled until the junction temperature is reduced. All register information is retained during thermal shutdown.

### Charge Pump Output Current Limit

The device also limits the charge pump current at the OUT pin. When OUT is shorted to ground, the typical output current is 400mA. The current limiting is triggered by an output under-voltage lockout below 2V. The output returns to normal when the short is removed and OUT is above 2.5V. Above 2.5V, a minimum current limit of 1000mA applies.

### LED Float Detection

Float detect is a fault detection feature of the LED current sink output. If the output is programmed to be enabled and an open circuit fault occurs on the current sink, the resulting open loop will cause the output voltage to change to the default condition  $V_{OUT} = 3.0V$ . The output will remain 3.0V until the loop is once again completed by an LED or the output is re-programmed to the off state.

## Applications Information (continued)

### PCB Layout Considerations

The layout diagram in Figure 1 illustrates a proper two-layer PCB layout for the SC628A and supporting components. Following fundamental layout rules is critical for achieving the performance specified in the Electrical Characteristics table. The following guidelines are recommended when developing a PCB layout:

- Place all bypass and decoupling capacitors — C1, C2, CIN, and COUT as close to the device as possible.
- All charge pump current passes through IN, OUT, and the bucket capacitor connection pins. Ensure that all connections to these pins make use of wide traces so that the resistive drop on each connection is minimized.
- The thermal pad should be connected to the ground plane using multiple vias to ensure proper thermal connection for optimal heat transfer.

- Make all ground connections to a solid ground plane as shown in the example layout (Figure 3).
- If a ground layer is not feasible, the following groupings should be connected:
  - PGND — CIN, COUT
  - AGND — Ground Pad
- If no ground plane is available, PGND and AGND should be routed back to the negative battery terminal as separate signals using thick traces.

Figure 1 — Recommended PCB Layout

Figure 2 — Layer 1

Figure 3 — Layer 2

## Register Map

Address	D7	D6	D5	D4	D3	D2	D1	D0	Reset Value	Description
0x02	Flash/Spotlight Bits		0 <sup>(1)</sup>	FLTO	Flash/Spotlight Bits				0x10	Flash/Spotlight Control

Notes:

(1) Always write a 0 to this bit

## Register and Bit Definitions

### Flash/Spotlight Control Register (0x02)

This register is used to select the flash or spotlight current and to configure the flash time-out feature.

#### Bits D7, D6, D3, D2, D1, D0

The value of bits D7, D6, D3, D2, D1, and D0 are used to set the current for the flash and spotlight modes. Flash current values are set in accordance with Table 1 on page 12, and spotlight current values are set in accordance with Table 2 on page 13.

#### FLTO

This bit is used to enable the flash safety time-out feature. The default state is enabled with FLTO = 1. If this bit is set, the device will turn off the flash after a nominal period of 1s. Two ways to re-enable the flash function after a safety time-out are:

- Pull the FLEN pin low to reset the flash function
- Clear and re-write bits D7, D6 D3, D2, D1, and D0.

## Register and Bit Definitions (continued)

- (2) Either 1 or 0.
- (3) Always write a 0 to this bit.
- (4) Write a 0 to reset the FLTO bit for spotlight mode.

## Serial Interface

### The I<sup>2</sup>C General Specification

The SC628A is a read-write slave-mode I<sup>2</sup>C device and complies with the Philips I<sup>2</sup>C standard Version 2.1, dated January 2000. The SC628A has four user-accessible internal 8-bit registers. The I<sup>2</sup>C interface has been designed for program flexibility, supporting direct format for write operation. Read operations are supported on both combined format and stop separated format. While there is no auto increment/decrement capability in the SC628A I<sup>2</sup>C logic, a tight software loop can be designed to randomly access the next register independent of which register you begin accessing. The start and stop commands frame the data-packet and the repeat start condition is allowed if necessary.

### SC628A Limitations to the I<sup>2</sup>C Specifications

The SC628A only recognizes seven bit addressing. This means that ten bit addressing and CBUS communication are not compatible. The device can operate in either standard mode (100kbit/s) or fast mode (400kbit/s).

### Slave Address Assignment

The seven bit slave address is 0110 111x. The eighth bit is the data direction bit. 0x6E is used for a write operation, and 0x6F is used for a read operation.

### Supported Formats

The supported formats are described in the following subsections.

#### Direct Format — Write

The simplest format for an I<sup>2</sup>C write is direct format. After the start condition [S], the slave address is sent, followed

by an eighth bit indicating a write. The SC628A I<sup>2</sup>C then acknowledges that it is being addressed, and the master responds with an 8 bit data byte consisting of the register address. The slave acknowledges and the master sends the appropriate 8 bit data byte. Once again the slave acknowledges and the master terminates the transfer with the stop condition [P].

#### Combined Format — Read

After the start condition [S], the slave address is sent, followed by an eighth bit indicating a write. The SC628A I<sup>2</sup>C then acknowledges that it is being addressed, and the master responds with an 8 bit data byte consisting of the register address. The slave acknowledges and the master sends the repeated start condition [Sr]. Once again, the slave address is sent, followed by an eighth bit indicating a read. The slave responds with an acknowledge and the previously addressed 8 bit data byte; the master then sends a non-acknowledge (NACK). Finally, the master terminates the transfer with the stop condition [P].

#### Stop Separated Reads

Stop-separated reads can also be used. This format allows a master to set up the register address pointer for a read and return to that slave at a later time to read the data. In this format the slave address followed by a write command are sent after a start [S] condition. The SC628A then acknowledges it is being addressed, and the master responds with the 8-bit register address. The master sends a stop or restart condition and may then address another slave. After performing other tasks, the master can send a start or restart condition to the SC628A with a read command. The device acknowledges this request and returns the data from the register location that had previously been set up.

## Serial Interface (continued)

### I<sup>2</sup>C Direct Format Write

S	Slave Address	W	A	Register Address	A	Data	A	P
---	---------------	---	---	------------------	---	------	---	---

S – Start Condition

W – Write = '0'

A – Acknowledge (sent by slave)

P – Stop condition

Slave Address – 7-bit

Register address – 8-bit

Data – 8-bit

### I<sup>2</sup>C Stop Separated Format Read

Register Address Setup Access							Master Addresses other Slaves		Register Read Access							
S	Slave Address	W	A	Register Address	A	P	S	Slave Address B		S/Sr	Slave Address	R	A	Data	NACK	P

S – Start Condition

W – Write = '0'

R – Read = '1'

A – Acknowledge (sent by slave)

NAK – Non-Acknowledge (sent by master)

Sr – Repeated Start condition

P – Stop condition

Slave Address – 7-bit

Register address – 8-bit

Data – 8-bit

### I<sup>2</sup>C Combined Format Read

S	Slave Address	W	A	Register Address	A	Sr	Slave Address	R	A	Data	NAK	P
---	---------------	---	---	------------------	---	----	---------------	---	---	------	-----	---

S – Start Condition

W – Write = '0'

R – Read = '1'

A – Acknowledge (sent by slave)

NAK – Non-Acknowledge (sent by master)

Sr – Repeated Start condition

P – Stop condition

Slave Address – 7-bit

Register address – 8-bit

Data – 8-bit

## Outline Drawing — MLPQ-UT-20 3x3

DIM	INCHES			MILLIMETERS		
	MIN	NOM	MAX	MIN	NOM	MAX
A	.020	-	.024	0.50	-	0.60
A1	.000	-	.002	0.00	-	0.05
A2	(.006)			(0.1524)		
b	.006	.008	.010	0.15	0.20	0.25
D	.114	.118	.122	2.90	3.00	3.10
D1	.061	.067	.071	1.55	1.70	1.80
E	.114	.118	.122	2.90	3.00	3.10
E1	.061	.067	.071	1.55	1.70	1.80
e	.016 BSC			0.40 BSC		
L	.012	.016	.020	0.30	0.40	0.50
N	20			20		
aaa	.003			0.08		
bbb	.004			0.10		

### NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.
3. DAP is 1.90 x 190mm.

## Land Pattern — MLPQ-UT-20 3x3

DIMENSIONS		
DIM	INCHES	MILLIMETERS
C	(.114)	(2.90)
G	.083	2.10
H	.067	1.70
K	.067	1.70
P	.016	0.40
R	.004	0.10
X	.008	0.20
Y	.031	0.80
Z	.146	3.70

### NOTES:

1. CONTROLLING DIMENSIONS ARE IN MILLIMETERS (ANGLES IN DEGREES).
2. THIS LAND PATTERN IS FOR REFERENCE PURPOSES ONLY. CONSULT YOUR MANUFACTURING GROUP TO ENSURE YOUR COMPANY'S MANUFACTURING GUIDELINES ARE MET.
3. THERMAL VIAS IN THE LAND PATTERN OF THE EXPOSED PAD SHALL BE CONNECTED TO A SYSTEM GROUND PLANE. FAILURE TO DO SO MAY COMPROMISE THE THERMAL AND/OR FUNCTIONAL PERFORMANCE OF THE DEVICE.
