# Anything-to-LVPECL/LVDS Translators with Pin-Selectable Divide-by-Four

**MAX9377/MAX9378**

## General Description

The MAX9377/MAX9378 are fully differential, high-speed, low-jitter anything-to-LVPECL and anything-to-LVDS translators, respectively, with a selectable divide-by-four function. Low propagation delay and high speed make them ideal for various high-speed network routing and backplane applications at speeds up to 2GHz in nondivide mode.

The MAX9377/MAX9378 accept any differential input signal within the supply rails and with minimum amplitude of 100mV. Inputs are fully compatible with the LVDS, LVPECL, HSTL, and CML differential signaling standards. The MAX9377 outputs are LVPECL and have sufficient current to drive 50Ω transmission lines. The MAX9378 outputs are LVDS and conform to the ANSI EIA/TIA-644 LVDS standard.

The MAX9377/MAX9378 are available in 8-pin μMAX packages and operate from a single +3.3V supply over the -40°C to +85°C temperature range.

## Features

- ◆ Guaranteed 2GHz Switching Frequency
- ◆ Accept LVDS/LVPECL/Anything Inputs
- ◆ Pin-Selectable Divide-by-Four Function
- ◆ 421ps (typ) Propagation Delays (MAX9377)
- ◆ 30ps (max) Pulse Skew
- ◆ 2ps<sub>RMS</sub> (max) Random Jitter
- ◆ Minimum 100mV Differential Input to Guarantee AC Specifications
- ◆ Temperature-Compensated LVPECL Output
- ◆ +3.0V to +3.6V Power-Supply Operating Range
- ◆ ESD Protection: >2kV Human Body Model (HBM)

## Applications

Backplane Logic Standard Translation  
 LAN  
 WAN  
 DSLAM  
 DLC

## Ordering Information

## ABSOLUTE MAXIMUM RATINGS

V <sub>CC</sub> to GND	-0.3V to +4.1V	Junction Temperature	+150°C
Inputs (IN, $\overline{IN}$ , RST, SEL)	-0.3V to (V <sub>CC</sub> + 0.3V)	Storage Temperature Range	-65°C to +150°C
IN to $\overline{IN}$	±3.0V	ESD Protection	
Short-Circuit Duration (MAX9378 OUT, $\overline{OUT}$ )	Continuous	Human Body Model (IN, $\overline{IN}$ , OUT, $\overline{OUT}$ )	≥2kV
Continuous Output Current	50mA	Soldering Temperature (10s)	+300°C
Surge Output Current	100mA		
Continuous Power Dissipation (T <sub>A</sub> = +70°C)			
8-μMAX (derate 5.9mW/°C above +70°C)	470.6mW		
θ <sub>JA</sub> in Still Air	+170°C/W		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = +3.0V to +3.6V, differential input voltage |V<sub>IDL</sub>| = 0.1V to 3.0V, input voltage (V<sub>IN</sub>, V $\overline{IN}$ ) = 0 to V<sub>CC</sub>, input common-mode voltage V<sub>CM</sub> = 0.05V to (V<sub>CC</sub> - 0.05V), LVPECL outputs terminated with 50Ω ±1% to (V<sub>CC</sub> - 2.0V), LVDS outputs terminated with 100Ω ±1%, T<sub>A</sub> = -40°C to +85°C. Typical values are at V<sub>CC</sub> = +3.3V, |V<sub>IDL</sub>| = 0.2V, input common-mode voltage V<sub>CM</sub> = 1.2V, T<sub>A</sub> = +25°C, unless otherwise noted.) (Notes 1, 2, 3)

Added Random Jitter	$t_{RJ}$	$f_{IN} = 1.34GHz$ (Note 7), SEL = 0		0.8	2	ps(RMS)

**Note 1:** Measurements are made with the device in thermal equilibrium. All voltages are referenced to ground except  $V_{THD}$ ,  $V_{ID}$ ,  $V_{OD}$ , and  $\Delta V_{OD}$ .

**Note 2:** Current into a pin is defined as positive. Current out of a pin is defined as negative.

**Note 3:** DC parameters production tested at  $T_A = +25^\circ C$  and guaranteed by design and characterization over the full operating temperature range.

**Note 4:** Guaranteed by design and characterization, not production tested. Limits are set at  $\pm 6$  sigma.

**Note 5:**  $t_{PCO}$  is the delay associated with the frequency-divider function. The total delay when divide-by-four is selected is  $t_{PCO} + t_{PLH}$ .

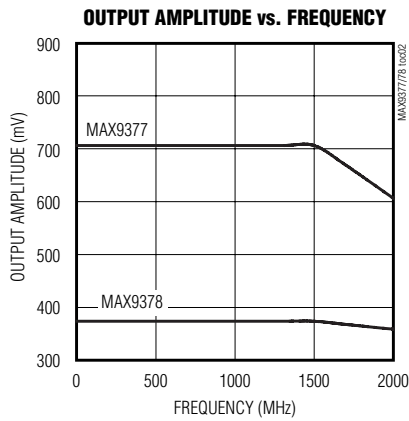

**Note 6:**  $t_{SKEW}$  is the magnitude difference of differential propagation delays for the same output under same conditions;  $t_{SKEW} = |t_{PHL} - t_{PLH}|$ .

**Note 7:** Device jitter added to the input signal.

# Anything-to-LVPECL/LVDS Translators with Pin-Selectable Divide-by-Four

## Pin Description

PIN	NAME	FUNCTION	
1	SEL	Frequency Divider Select Input. High = divide by four, low = no division. Internal 75kΩ pull-down to GND.	
2	IN	Differential LVDS/Any Noninverting Input	
3	$\overline{\text{IN}}$	Differential LVDS/Any Inverting Input	
4	GND	Ground	
5	RST	Frequency Divider Reset Input. Active high, asynchronous, reset. Internal 75kΩ pull-down to GND.	
6	$\overline{\text{OUT}}$	MAX9377	Differential LVPECL Inverting Output. Terminate with 50Ω ±1% to V <sub>CC</sub> - 2V.
		MAX9378	Inverting LVDS Output. Terminate to OUT with 100Ω ±1%.
7	OUT	MAX9377	Differential LVPECL Noninverting Output. Terminate with 50Ω ±1% to V <sub>CC</sub> - 2V.
		MAX9378	Noninverting LVDS Output. Terminate to $\overline{\text{OUT}}$ with 100Ω ±1%.
8	V <sub>CC</sub>	Positive Supply. Bypass from V <sub>CC</sub> to GND with 0.1μF and 0.01μF ceramic capacitors. Place the capacitors as close to the device as possible with the smaller value capacitor closest to the device	

### Detailed Description

The MAX9377/MAX9378 are fully differential, high-speed, low-jitter anything-to-LVPECL and anything-to-LVDS translators, respectively, with a selectable divide-by-four function. Low propagation delay and high speed make them ideal for various high-speed network routing and backplane applications at speeds up to 2GHz in nondivide mode.

The MAX9377/MAX9378 accept any differential input signals within the supply rails and with a minimum amplitude of 100mV. Inputs are fully compatible with the LVDS, LVPECL, HSTL, and CML differential signaling standards. The MAX9377 outputs are LVPECL and have sufficient current to drive 50Ω transmission lines. The MAX9378 outputs are LVDS and conform to the ANSI EIA/TIA-644 LVDS standard.

#### Inputs

Inputs have a wide common-mode range of 0.05V to (V<sub>CC</sub> - 0.05V), which accommodates any differential signals within the supply rails, and requires a minimum of 100mV to switch the outputs. This allows the MAX9377/MAX9378 inputs to support virtually any differential signaling standard.

#### RST and SEL Inputs

The frequency-divide functions are controlled by two LVCMOS/LVTTL inputs, RST and SEL. SEL selects either the divide-by-four function or a no-division function as shown in Table 1. RST, an asynchronous active-high input, resets the divide-by-four within the device and places the circuits into a known state. Setting RST

Table 1. SEL AND RST Truth Table

RST	SEL	OUTPUT
X	L or open	No frequency division.
H	H	Outputs are placed in differential low.
L	H	Divide-by-four function.

high when powering up the device with SEL high prevents the unknown states with the divider from being propagated to the outputs. If the device is powered up with SEL high but without asserting RST, the outputs are only guaranteed to be 1/4th the input frequency after 2.5 cycles have been applied to the input.

#### LVPECL Outputs (MAX9377)

The MAX9377 LVPECL outputs are emitter followers that require external resistive paths to a voltage source (V<sub>T</sub> = V<sub>CC</sub> - 2.0V typ) more negative than worst-case V<sub>OL</sub> for proper static and dynamic operation. When properly terminated, the outputs generate steady-state voltage levels, V<sub>OL</sub> or V<sub>OH</sub> with fast transition edges between state levels. Output current always flows into the termination during proper operation.

#### LVDS Outputs (MAX9378)

The MAX9378 LVDS outputs require a resistive load to terminate the signal and complete the transmission loop. Because the device switches current and not voltage, the actual output voltage swing is determined by the value of the termination resistor. With a 3.5mA typical output current, the MAX9378 produces an output voltage of 350mV when driving a 100Ω load.

### Applications Information

#### LVPECL Output Termination (MAX9377)

Terminate the MAX9377 LVPECL outputs with  $50\Omega$  to  $(V_{CC} - 2V)$  or use equivalent Thevenin terminations. Terminate  $\overline{OUT}$  and  $OUT$  with identical terminations on each for low output distortion. When a single-ended signal is taken from the differential output, terminate both  $\overline{OUT}$  and  $OUT$ . Ensure that output currents do not exceed the current limits as specified in the *Absolute Maximum Ratings*. Under all operating conditions, the device's total thermal limits should be observed.

#### LVDS Output Termination (MAX9378)

The MAX9378 LVDS outputs are current-steering devices; no output voltage is generated without a termination resistor. The termination resistors should match the differential impedance of the transmission line. Output voltage levels are dependent upon the value of the termination resistor. The MAX9378 is optimized for point-to-point communication with the  $100\Omega$  termination resistor at the receiver inputs. Termination resistance values may range between  $90\Omega$  and  $132\Omega$ , depending on the characteristic impedance of the transmission medium.

#### Supply Bypassing

Bypass  $V_{CC}$  to ground with high-frequency surface-mount ceramic  $0.1\mu F$  and  $0.01\mu F$  capacitors. Place the capacitors as close to the device as possible with the  $0.01\mu F$  capacitor closest to the device pins.

#### Traces

Circuit board trace layout is very important to maintain the signal integrity of high-speed differential signals.

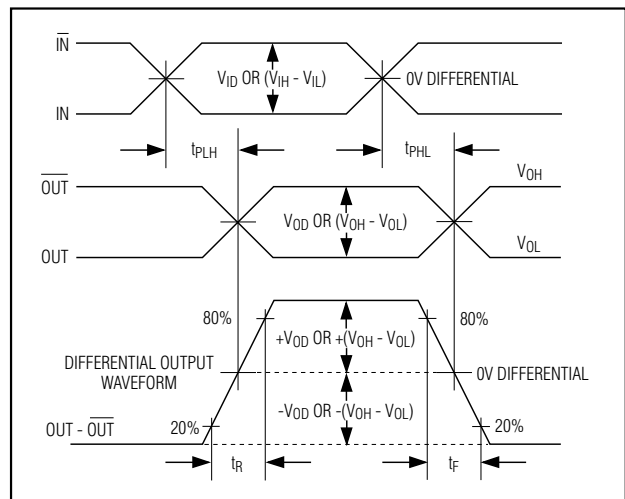

Figure 3. Differential Input-to-Output Propagation Delay Timing Diagram

Maintaining integrity is accomplished in part by reducing signal reflections and skew, and increasing common-mode noise immunity.

Signal reflections are caused by discontinuities in the  $50\Omega$  characteristic impedance of the traces. Avoid discontinuities by maintaining the distance between differential traces, not using sharp corners or using vias. Maintaining distance between the traces also increases common-mode noise immunity. Reducing signal skew is accomplished by matching the electrical length of the differential traces.
