SN74ALVCH16831 1-TO-4 ADDRESS REGISTER/DRIVER WITH 3-STATE OUTPUTS

SCES083F-AUGUST 1996-REVISED SEPTEMBER 2004

FEATURES

- Member of the Texas Instruments Widebus™
 Family
- Bus Hold on Data Inputs Eliminates the Need for External Pullup/Pulldown Resistors
- Latch-Up Performance Exceeds 250 mA Per JESD 17
- ESD Protection Exceeds JESD 22
 - 2000-V Human-Body Model (A114-A)
 - 200-V Machine Model (A115-A)
 - 1000-V Charged-Device Model (C101)

DESCRIPTION/ORDERING INFORMATION

This 1-bit to 4-bit address register/driver is designed for 1.65-V to 3.6-V V_{CC} operation. The device is ideal for use in applications in which a single address bus is driving four separate memory locations. The SN74ALVCH16831 can be used as a buffer or a register, depending on the logic level of the select (\overline{SEL}) input.

When \overline{SEL} is logic high, the device is in the buffer mode. The outputs follow the inputs and are controlled by the two output-enable (\overline{OE}) controls. Each \overline{OE} controls two groups of nine outputs.

When SEL is logic low, the device is in the register mode. The register is an edge-triggered D-type flip-flop. On the positive transition of the clock (CLK) input, data set up at the A inputs is stored in the internal registers. OE controls operate the same as in buffer mode.

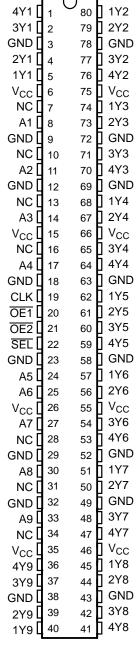

When \overline{OE} is logic low, the outputs are in a normal logic state (high or low logic level). When \overline{OE} is logic high, the outputs are in the high-impedance state.

SEL and OE do not affect the internal operation of the flip-flops. Old data can be retained or new data can be entered while the outputs are in the high-impedance state.

To ensure the high-impedance state during power up or power down, $\overline{\text{OE}}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Active bus-hold circuitry holds unused or undriven inputs at a valid logic state. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

I _{OK}	Output clamp current	V _O < 0		-50	mA
Io	Continuous output current			±50	mA
	Continuous current through each V _{CC} or	GND		±100	mA
θ_{JA}	Package thermal impedance (4)			64	°C/W
T _{stg}	Storage temperature range		-65	150	°C

Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

T _A	Operating free-air temperature		-40	85	°C

All unused control inputs of the device must be held at V_{CC} or GND to ensure proper device operation. Refer to the TI application report, Implications of Slow or Floating CMOS Inputs, literature number SCBA004.

This value is limited to 4.6 V, maximum.

The package thermal impedance is calculated in accordance with JESD 51-7.
