# ±15kV ESD-Protected 52Mbps, 3V to 5.5V, SOT23 RS-485/RS-422 True Fail-Safe Receivers

## General Description

## Features

The MAX3280E/MAX3281E/MAX3283E/MAX3284E are single receivers designed for RS-485 and RS-422 communication. These devices guarantee data rates up to 52Mbps, even with a 3V power supply. Excellent propagation delay (15ns max) and package-to-package skew time (8ns max) make these devices ideal for mult-drop clock distribution applications.

The MAX3280E/MAX3281E/MAX3283E/MAX3284E have true fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are opened or shorted. The receiver output will be a logic high if all transmitters on a terminated bus are disabled (high impedance). These devices feature 1/4-unit-load receiver input impedance, allowing up to 128 receivers on the same bus.

The MAX3280E is a single receiver available in a 5-pin SOT23 package. The MAX3281E/MAX3283E single receivers have a receiver enable (EN or  $\overline{\text{EN}}$ ) function and are offered in a 6-pin SOT23 package. The MAX3284E features a voltage logic pin that allows compatibility with low-voltage logic levels, as in digital FPGAs/ASICs. On the MAX3284E, the voltage threshold for a logic high is user-defined by setting  $V_L$  in the range from 1.65V to  $V_{CC}$ . The MAX3284E is also offered in a 6-pin SOT23 package.

- ◆ ESD Protection:
  - ±15kV—Human Body Model
  - ±6kV—IEC 1000-4-2, Contact Discharge
  - ±12kV—IEC 1000-4-2, Air-Gap Discharge
- ◆ Guaranteed 52Mbps Data Rate
- ◆ Guaranteed 15ns Receiver Propagation Delay
- ◆ Guaranteed 2ns Receiver Skew
- ◆ Guaranteed 8ns Package-to-Package Skew Time
- ◆  $V_L$  Pin for Connection to FPGAs/ASICs
- ◆ Allow Up to 128 Transceivers on the Bus (1/4-unit-load)
- ◆ Tiny SOT23 Package
- ◆ True Fail-Safe Receiver
- ◆ -7V to +12V Common-Mode Range
- ◆ 3V to 5.5V Power-Supply Range
- ◆ Enable (High and Low) Pins for Redundant Operation
- ◆ Three-State Output Stage (MAX3281E/MAX3283E)
- ◆ Thermal Protection Against Output Short Circuit

## Applications

Clock Distribution  
 Telecom Racks  
 Base Stations  
 Industrial Control  
 Local Area Networks

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	TOP MARK
MAX3280EAUK-T	-40°C to +125°C	5 SOT23-5	ADVM

MAX3284EAUT-T	-40°C to +125°C	6 SOT23-6	ABAV

Pin Configurations appear at end of data sheet.

## Selector Guide

PART	$V_L$	ENABLE	DATA RATE	PACKAGE
MAX3280E	—	—	52Mbps	5-Pin SOT23
MAX3281E	—	Active High	52Mbps	6-Pin SOT23
MAX3283E	—	Active Low	52Mbps	6-Pin SOT23
MAX3284E	✓	—	52Mbps (Note 1)	6-Pin SOT23

Note 1: MAX3284E data rate is dependent on  $V_L$ .

# ±15kV ESD-Protected 52Mbps, 3V to 5.5V, SOT23 RS-485/RS-422 True Fail-Safe Receivers

## ABSOLUTE MAXIMUM RATINGS

(All Voltages Referenced to GND)

Supply Voltage (V <sub>CC</sub> )	-0.3V to +6V	Continuous Power Dissipation (T <sub>A</sub> = +70°C)	
Control Input Voltage (EN, $\overline{\text{EN}}$ )	-0.3V to +6V	5-Pin SOT23 (derate 7.1mW/°C above +70°C)	571mW
V <sub>L</sub> Input Voltage	-0.3V to +6V	6-Pin SOT23 (derate 8.7mW/°C above +70°C)	696mW
Receiver Input Voltage (A, B)	-7.5V to +12.5V	Operating Temperature Range	
Receiver Output Voltage (RO)	-0.3V to (V <sub>CC</sub> + 0.3V)	MAX328_EA_	-40°C to +125°C
Receiver Output Voltage (RO) (MAX3284E)	-0.3V to (V <sub>L</sub> + 0.3V)	Storage Temperature Range	-65°C to +150°C
Receiver Output Short-Circuit Current	Continuous	Junction Temperature	+150°C
		Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = 3V to 5.5V, V<sub>L</sub> = V<sub>CC</sub>, T<sub>A</sub> = T<sub>MIN</sub> to T<sub>MAX</sub>, unless otherwise noted. Typical values are at V<sub>CC</sub> = 5V and T<sub>A</sub> = +25°C.) (Notes 2, 3)

## Pin Description

PIN				NAME	FUNCTION
MAX3280E	MAX3281E	MAX3283E	MAX3284E		
1	1	1	1	V <sub>CC</sub>	Positive Supply: $3V \leq V_{CC} \leq 5.5V$ . Bypass with a 0.1µF capacitor to GND.
2	2	2	2	GND	Ground
3	3	3	3	RO	Receiver Output. RO will be high if (A-B) ≥ -50mV. RO will be low if (A-B) ≤ -200mV.
4	4	4	4	B	Inverting Receiver Input
—	—	5	—	$\overline{EN}$	Receiver Output Enable. Drive $\overline{EN}$ low to enable RO. When $\overline{EN}$ is high, RO is high impedance.
—	5	—	—	EN	Receiver Output Enable. Drive EN high to enable RO. When EN is low, RO is high impedance.
—	—	—	5	V <sub>L</sub>	Low-Voltage Logic-Level Supply Voltage. V <sub>L</sub> is a user-defined voltage, ranging from 1.65V to V <sub>CC</sub> . RO output high is pulled up to V <sub>L</sub> . Bypass with a 0.1µF capacitor to GND.
5	6	6	6	A	Noninverting Receiver Input

### Detailed Description

The MAX3280E/MAX3281E/MAX3283E/MAX3284E are single, true fail-safe receivers designed to operate at data rates up to 52Mbps. The fail-safe architecture guarantees a high output signal if both input terminals are open or shorted together. See the *True Fail-Safe* section. This feature assures a stable and predictable output logic state with any transmitter driving the line. These receivers function with a 3.3V or 5V supply voltage and feature excellent propagation delay times (15ns).

The MAX3280E is a single receiver available in a 5-pin SOT23 package. The MAX3281E (EN, active high) and MAX3283E ( $\overline{EN}$ , active low) are single receivers that also contain an enable pin. Both the MAX3281E and MAX3283E are available in a 6-pin SOT23 package. The MAX3284E is a single receiver that contains a V<sub>L</sub> pin, which allows communication with low-level logic included in digital FPGAs. The MAX3284E is available in a 6-pin SOT23 package.

The MAX3284E's low-level logic application allows users to set the logic levels. A logic high level of 1.65V will limit the maximum data rate to 20Mbps.

### ±15kV ESD Protection

ESD-protection structures are incorporated on the receiver input pins to protect against ESD encountered during handling and assembly. The MAX3280E/MAX3281E/MAX3283E/MAX3284E receiver inputs (A, B) have extra protection against static electricity found in normal operation. Maxim's engineers developed state-of-the-art structures to protect these pins against

±15kV ESD without damage. After an ESD event, this family of parts continues working without latchup.

ESD protection can be tested in several ways. The receiver inputs are characterized for protection to the following:

- ±15kV using the Human Body Model
- ±6kV using the Contact Discharge method specified in IEC 1000-4-2 (formerly IEC 801-2)
- ±12kV using the Air-Gap Discharge method specified in IEC 1000-4-2 (formerly IEC 801-2)

### ESD Test Conditions

ESD performance depends on a number of conditions. Contact Maxim for a reliability report that documents test setup, methodology, and results.

### Human Body Model

Figure 3a shows the Human Body Model, and Figure 3b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the device through a 1.5kΩ resistor.

### IEC 1000-4-2

Since January 1996, all equipment manufactured and/or sold in the European community has been required to meet the stringent IEC 1000-4-2 specification. The IEC 1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits. The MAX3280E/MAX3281E/MAX3283E/MAX3284E help

MAX3280E/MAX3281E/MAX3283E/MAX3284E

## ±15kV ESD-Protected 52Mbps, 3V to 5.5V, SOT23 RS-485/RS-422 True Fail-Safe Receivers

users design equipment that meets Level 3 of IEC 1000-4-2, without additional ESD-protection components.

The main difference between tests done using the Human Body Model and IEC 1000-4-2 is higher peak current in IEC 1000-4-2. Because series resistance is lower in the IEC 1000-4-2 ESD test model (Figure 4a), the ESD-withstand voltage measured to this standard is generally lower than that measured using the Human Body Model. Figure 4b shows the current waveform for the ±8kV IEC 1000-4-2 Level 4 ESD Contact Discharge test. The Air-Gap test involves approaching the device with a charger probe. The Contact Discharge method connects the probe to the device before the probe is energized.

### Machine Model

The Machine Model for ESD testing uses a 200pF storage capacitor and zero-discharge resistance. It mimics the stress caused by handling during manufacturing and assembly. All pins (not just the RS-485 inputs) require this protection during manufacturing. Therefore, the Machine Model is less relevant to the I/O ports than are the Human Body Model and IEC 1000-4-2.

### True Fail-Safe

The MAX3280E/MAX3281E/MAX3283E/MAX3284E guarantee a logic-high receiver output when the receiver inputs are shorted or open, or when they are connected to a terminated transmission line with all drivers disabled. This guaranteed logic high is achieved by setting the receiver threshold between -50mV and -200mV. If the differential receiver input voltage (A-B) is greater than or equal to -50mV, RO is logic high. If (A-B) is less than or equal to -200mV, RO is logic low.

In the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to ground by the termination. This results in a logic high with a 50mV minimum noise margin. Unlike previous fail-safe devices, the -50mV to -200mV threshold complies with the ±200mV EIA/TIA-485 standard.

### Receiver Enable (MAX3281E and MAX3283E only)

The MAX3281E and MAX3283E feature a receiver output enable (EN, MAX3281E or  $\overline{\text{EN}}$ , MAX3283E) input that controls the receiver. The MAX3281E receiver enable (EN) pin is active high, meaning the receiver outputs are active when EN is high. The MAX3283E receiver enable ( $\overline{\text{EN}}$ ) pin is active low. Receiver outputs are high impedance when the MAX3281E's EN pin is low and when the MAX3283E's  $\overline{\text{EN}}$  pin is high.

**Table 1. MAX3281E/MAX3283E Enable Table**

PART	ENABLE = HIGH	ENABLE = LOW
MAX3281E	Active	High Z
MAX3283E	High Z	Active

### Low-Voltage Logic Levels (MAX3284E only)

An increasing number of applications now operate at low-voltage logic levels. To enable compatibility with these low-voltage logic level applications, such as digital FPGAs, the MAX3284E  $V_L$  pin is a user-defined supply voltage that designates the voltage threshold for a logic high.

At lower  $V_L$  voltages, the data rate will also be lower. A logic-high level of 1.65V will receive data at 20Mbps. Table 2 gives data rates at various voltages at  $V_L$ .

**Table 2. MAX3284E Data Rate Table**

$V_{CC} = 3V \text{ TO } 5.5V$	
$V_L$	MAXIMUM DATA RATE
1.65V	20Mbps
2.2V	33Mbps
≥3.3V	52Mbps

## Applications Information

### Propagation Delay Matching

The MAX3280E/MAX3281E/MAX3283E/MAX3284E ( $V_{CC} = V_L$ ) exhibit propagation delays that are closely matched from one device to another, even between devices from different production lots. This feature allows multiple data lines to receive data and clock signals with minimal skew with respect to each other. Figure 5 shows the typical propagation delays. Small receiver skew times, the difference between the low-to-high and high-to-low propagation delay, help maintain a symmetrical ratio (50% duty cycle). The receiver skew time  $|t_{PLH} - t_{PHL}|$  is under 2ns for either a 3.3V supply or a 5V supply.

### Multidrop Clock Distribution

Low package-to-package skew (8ns max) makes the MAX3280E/MAX3281E/MAX3283E/MAX3284E ( $V_{CC} = V_L$ ) ideal for multidrop clock distribution. When distributing a clock signal to multiple circuits over long transmission lines, receivers in separate locations, and possibly at two different temperatures, would ideally

# ±15kV ESD-Protected 52Mbps, 3V to 5.5V, SOT23 RS-485/RS-422 True Fail-Safe Receivers

provide the same clock to their respective circuits. Thus, minimal package-to-package skew is critical. The skew must be kept well below the period of the clock signal to ensure that all of the circuits on the network are synchronized.

### 128 Receivers on the Bus

The standard RS-485 input impedance is 12kΩ (one-unit load). The standard RS-485 transmitter can drive 32 unit loads. The MAX3280E/MAX3281E/MAX3283E/MAX3284E present a 1/4-unit-load input impedance

(48kΩ), which allows up to 128 receivers on the bus. Any combination of these RS-485 receivers with a total of 32 unit loads can be connected to the same bus.

### Thermal Protection

The MAX3280E/MAX3281E/MAX3283E/MAX3284E feature thermal protection. Thermal protection sets the output stage in high-impedance mode when a short circuit occurs at the output, limiting both the power dissipation and temperature. The thermal temperature threshold is +165°C, with a hysteresis of 20°C.
