## LMV93x-N/-N-Q1 Single, Dual, Quad 1.8-V, RRIO Operational Amplifiers

### 1 Features

- Typical 1.8-V Supply Values; Unless Otherwise Noted
- Available in Automotive AEC-Q100 Grade 1
- Specified at 1.8-V, 2.7-V and 5-V
- Output Swing
  - With 600-Ω Load 80 mV from Rail
  - With 2-kΩ Load 30 mV from Rail
- $V_{CM}$  200 mV Beyond Rails
- Supply Current (per Channel) 100 μA
- Gain Bandwidth Product 1.4 MHz
- Maximum  $V_{OS}$  4.0 mV
- Ultra Tiny Packages
- Temperature Range -40°C to 125°C

### 2 Applications

- Mobile Phones
- Tablets
- Wearables
- Health Monitoring
- Portable and Battery-Powered Electronic Equipment
- Battery Monitoring

### 3 Description

The LMV93x-N family (LMV931-N single, LMV932-N dual and LMV934-N quad) are low-voltage, low-power operational amplifiers. The LMV93x-N family operates from 1.8-V to 5.5-V supply voltages and have rail-to-rail input and output. The input common-mode voltage extends 200 mV beyond the supplies which enables user enhanced functionality beyond the supply voltage range. The output can swing rail-to-rail unloaded and within 105 mV from the rail with 600-Ω load at 1.8-V supply. The LMV93x-N devices are optimized to work at 1.8 V, which make them ideal for portable two-cell, battery-powered systems and single-cell Li-Ion systems.

LMV93x-N devices exhibit an excellent speed-power ratio, achieving 1.4-MHz gain bandwidth product at 1.8-V supply voltage with very low supply current. The LMV93x-N devices can drive a 600-Ω load and up to 1000-pF capacitive load with minimal ringing. These devices also have a high DC gain of 101 dB, making them suitable for low-frequency applications.

The single LMV93x-N is offered in space-saving 5-pin SC70 and SOT-23 packages. The dual LMV932-N are in 8-pin VSSOP and SOIC packages and the quad LMV934-N are in 14-pin TSSOP and SOIC packages. These small packages are ideal solutions for area constrained PC boards and portable electronics such as mobile phones and tablets.

The LMV93x-N-Q1 family retains all the LMV93x-N family features while adding AEC-Q100 Grade 1 qualification for automotive applications.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMV931-N	SOT-23 (5)	2.90 mm × 1.60 mm
LMV931-N-Q1	SC-70 (5)	2.00 mm × 1.25 mm
LMV932-N	VSSOP (8)	3.00 mm × 3.00 mm
LMV932-N-Q1	SOIC (8)	4.90 mm × 3.91 mm
LMV934-N	TSSOP (8)	5.00 mm × 4.40 mm
LMV934-N-Q1	SOIC (14)	8.60 mm × 3.90 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

#### High-Side Current Sense Amplifier

$$V_{OUT} = \frac{R_{SENSE} \cdot R_3}{R_1} \cdot I_{CHARGE} = 1.0 \cdot I_{CHARGE}$$

## 6 Specifications

### 6.1 Absolute Maximum Ratings

 See <sup>(1)(2)</sup>.

	MIN	MAX	UNIT
Supply voltage ( $V^+ - V^-$ )	-0.3	6	V
Differential input voltage	$V^-$	$V^+$	
Voltage at input/output pins	$(V^-) - 0.3$	$(V^+) + 0.3$	
Junction temperature <sup>(3)</sup>	-40	150	°C

- Absolute Maximum Ratings** indicate limits beyond which damage to the device may occur. **Recommended Operating Conditions** indicate conditions for which the device is intended to be functional, but specific performance is not specified. For specifications and the test conditions, see the [Electrical Characteristics](#).
- If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- The maximum power dissipation is a function of  $T_{J(max)}$ ,  $R_{\theta JA}$ , and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(max)} - T_A) / R_{\theta JA}$ . All numbers apply for packages soldered directly into a PC board.

### 6.2 Handling Ratings - Commercial

	MIN	MAX	UNIT
$T_{stg}$ Storage temperature range	-65	150	°C
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)(2)</sup>	2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(3)</sup>	750	
	Machine Model (MM) <sup>(4)</sup>	200	

- JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.
- JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.
- Machine model, 200  $\Omega$  in series with 100-pF.

### 6.3 Handling Ratings - Automotive

	MIN	MAX	UNIT
$T_{stg}$ Storage temperature range	-65	150	°C
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup>	2000	V
	Charged device model (CDM), per AEC Q100-011	750	
	Machine Model (MM) <sup>(2)</sup>	200	

- AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.
- Machine model, 200  $\Omega$  in series with 100-pF.

### 6.4 Recommended Operating Ratings

 See <sup>(1)</sup>.

	MIN	MAX	UNIT
Supply Voltage Range ( $V^+ - V^-$ )	1.8	5.5	V
Temperature Range	-40	125	°C

- Absolute Maximum Ratings** indicate limits beyond which damage to the device may occur. **Recommended Operating Conditions** indicate conditions for which the device is intended to be functional, but specific performance is not specified. For specifications and the test conditions, see the [Electrical Characteristics](#).

### 6.5 Thermal Information

THERMAL METRIC <sup>(1)</sup>	LMV921		LMV922		LMV924		UNIT
	DCK	DBV	DGK	D	DGK	D	
	5 PINS		8 PINS		14 PINS		
$R_{\theta JA}$ Junction-to-ambient thermal resistance	414	265	235	175	155	127	°C/W

- For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.6 DC Electrical Characteristics 1.8 V

Unless otherwise specified, all limits specified for  $T_J = 25^\circ\text{C}$ .  $V^+ = 1.8\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{CM} = V^+/2$ ,  $V_O = V^+/2$  and  $R_L > 1\text{ M}\Omega$ .

- (1) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration.
- (2) For specified temperature ranges, see the CMVR parameter in [DC Electrical Characteristics 1.8 V](#) for the input common-mode voltage specifications.

**LMV931-N, LMV931-N-Q1  
LMV932-N, LMV932-N-Q1, LMV934-N, LMV934-N-Q1**

SNOS9930 – NOVEMBER 2001 – REVISED DECEMBER 2014

[www.ti.com](http://www.ti.com)
**DC Electrical Characteristics 1.8 V (continued)**

 Unless otherwise specified, all limits specified for  $T_J = 25^\circ\text{C}$ .  $V^+ = 1.8\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{\text{CM}} = V^+/2$ ,  $V_O = V^+/2$  and  $R_L > 1\text{ M}\Omega$ .

PARAMETER		TEST CONDITIONS		MIN	TYP (1)	MAX	UNIT
$V_O$	Output Swing LMV932-N-Q1 (Dual) LMV934-N-Q1 (Quad)	$R_L = 600\ \Omega$ to $0.9\text{ V}$ $V_{\text{IN}} = \pm 100\text{ mV}$	$25^\circ\text{C}$	1.65	1.72		V
			Full Range	1.63		0.105	
		$R_L = 2\text{ k}\Omega$ to $0.9\text{ V}$ $V_{\text{IN}} = \pm 100\text{ mV}$	$25^\circ\text{C}$	1.75	1.77		V
			Full Range	1.74		0.055	
$I_O$	Output Short Circuit Current <sup>(3)</sup>	Sourcing, $V_O = 0\text{ V}$ $V_{\text{IN}} = 100\text{ mV}$	$25^\circ\text{C}$	4	8		mA
			Full Range	3.3			
		Sinking, $V_O = 1.8\text{ V}$ $V_{\text{IN}} = -100\text{ mV}$	$25^\circ\text{C}$	7	9		mA
			Full Range	5			

(3) Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ . Output currents in excess of 45 mA over long term may adversely affect reliability.

**6.7 AC Electrical Characteristics 1.8 V**

 Unless otherwise specified, all limits specified for  $T_J = 25^\circ\text{C}$ .  $V^+ = 1.8\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{\text{CM}} = V^+/2$ ,  $V_O = V^+/2$  and  $R_L > 1\text{ M}\Omega$ .

PARAMETER		TEST CONDITIONS		MIN	TYP (1)	MAX	UNIT
SR	Slew Rate	See <sup>(2)</sup> .			0.35		V/ $\mu\text{s}$
GBW	Gain-Bandwidth Product				1.4		MHz
$\Phi_m$	Phase Margin				67		deg
$G_m$	Gain Margin				7		dB
$e_n$	Input-Referred Voltage Noise	$f = 10\text{ kHz}$ , $V_{\text{CM}} = 0.5\text{ V}$			60		nV/ $\sqrt{\text{Hz}}$
$i_n$	Input-Referred Current Noise	$f = 10\text{ kHz}$			0.08		pA/ $\sqrt{\text{Hz}}$
THD	Total Harmonic Distortion	$f = 1\text{ kHz}$ , $A_V = +1$ $R_L = 600\ \Omega$ , $V_{\text{IN}} = 1\text{ V}_{\text{PP}}$			0.023%		
	Amplifier-to-Amplifier Isolation	See <sup>(3)</sup>			123		dB

- (1) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration.
- (2) Connected as voltage follower with input step from  $V^-$  to  $V^+$ . Number specified is the slower of the positive and negative slew rates.
- (3) Input referred,  $R_L = 100\text{ k}\Omega$  connected to  $V^+/2$ . Each amplifier excited in turn with 1 kHz to produce  $V_O = 3\text{ V}_{\text{PP}}$  (For Supply Voltages  $< 3\text{ V}$ ,  $V_O = V^+$ ).

## 6.8 DC Electrical Characteristics 2.7 V

Unless otherwise specified, all limits specified for  $T_J = 25^\circ\text{C}$ .  $V^+ = 2.7\text{ V}$ ,  $V^- = 0\text{ V}$ ,  $V_{CM} = V^+/2$ ,  $V_O = V^+/2$  and  $R_L > 1\text{ M}\Omega$ .

**7 Detailed Description**

**7.1 Overview**

The LMV93x-N are low-voltage, low-power operational amplifiers (op-amp) operating from 1.8-V to 5.5-V supply voltages and have rail-to-rail input and output. LMV93x-N input common-mode voltage extends 200 mV beyond the supplies which enables user enhanced functionality beyond the supply voltage range.

**7.2 Functional Block Diagram**

(Each Amplifier)

**7.3 Feature Description**

The differential inputs of the amplifier consist of a noninverting input (+IN) and an inverting input (-IN). The amplifier amplifies only the difference in voltage between the two inputs, which is called the differential input voltage. The output voltage of the op-amp  $V_{OUT}$  is given by Equation 1:

$$V_{OUT} = A_{OL} (IN^+ - IN^-)$$

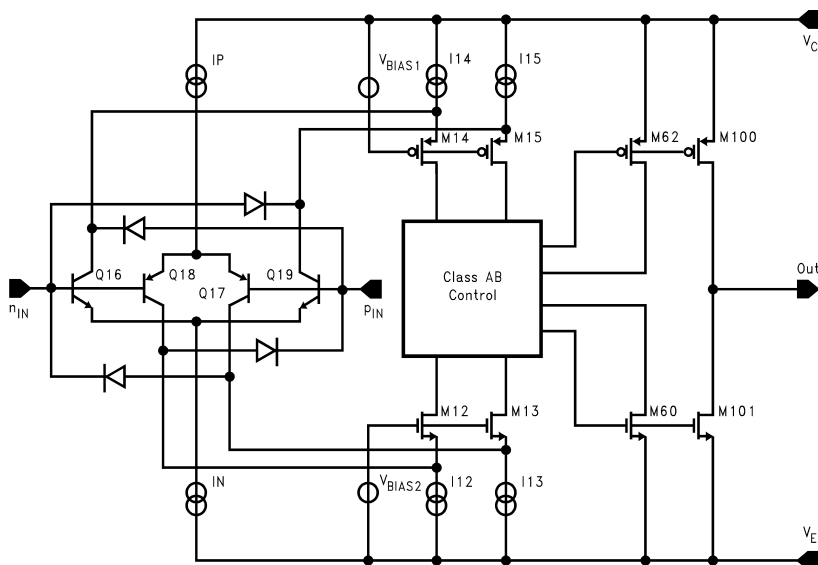

where

- $A_{OL}$  is the open-loop gain of the amplifier, typically around 100 dB (100,000x, or 10 uV per volt). (1)

**7.4 Device Functional Modes**

**7.4.1 Input and Output Stage**

The rail-to-rail input stage of this family provides more flexibility for the designer. The LMV93x-N use a complimentary PNP and NPN input stage in which the PNP stage senses common-mode voltage near  $V^-$  and the NPN stage senses common-mode voltage near  $V^+$ . The transition from the PNP stage to NPN stage occurs 1 V below  $V^+$ . Because both input stages have their own offset voltage, the offset of the amplifier becomes a function of the input common-mode voltage and has a crossover point at 1 V below  $V^+$ .

**Figure 28. Simplified Schematic Diagram**

## Device Functional Modes (continued)

This  $V_{OS}$  crossover point can create problems for both DC- and AC-coupled signals if proper care is not taken. Large input signals that include the  $V_{OS}$  crossover point will cause distortion in the output signal. One way to avoid such distortion is to keep the signal away from the crossover. For example, in a unity gain buffer configuration with  $V_S = 5\text{ V}$ , a 5-V peak-to-peak signal will contain input-crossover distortion while a 3-V peak-to-peak signal centered at 1.5 V will not contain input-crossover distortion as it avoids the crossover point. Another way to avoid large signal distortion is to use a gain of  $-1$  circuit which avoids any voltage excursions at the input terminals of the amplifier. In that circuit, the common-mode DC voltage can be set at a level away from the  $V_{OS}$  cross-over point. For small signals, this transition in  $V_{OS}$  shows up as a  $V_{CM}$  dependent spurious signal in series with the input signal and can effectively degrade small signal parameters such as gain and common-mode rejection ratio. To resolve this problem, the small signal should be placed such that it avoids the  $V_{OS}$  crossover point. In addition to the rail-to-rail performance, the output stage can provide enough output current to drive 600- $\Omega$  loads. Because of the high-current capability, take care not to exceed the 150°C maximum junction temperature specification.

### 7.4.2 Input Bias Current Consideration

The LMV93x-N family has a complementary bipolar input stage. The typical input bias current ( $I_B$ ) is 15 nA. The input bias current can develop a significant offset voltage. This offset is primarily due to  $I_B$  flowing through the negative feedback resistor,  $R_F$ . For example, if  $I_B$  is 50 nA and  $R_F$  is 100 k $\Omega$ , then an offset voltage of 5 mV will develop ( $V_{OS} = I_B \times R_F$ ). Using a compensation resistor ( $R_C$ ), as shown in Figure 29, cancels this effect. But the input offset current ( $I_{OS}$ ) will still contribute to an offset voltage in the same manner.

**Figure 29. Canceling the Offset Voltage due to Input Bias Current**

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LMV93x-N devices bring performance, economy and ease-of-use to low-voltage, low-power systems. They provide rail-to-rail input and rail-to-rail output swings into heavy loads.

### 8.2 Typical Applications

#### 8.2.1 High-Side Current-Sensing Application

Figure 30. High-Side Current Sensing

##### 8.2.1.1 Design Requirements

The high-side current-sensing circuit (Figure 30) is commonly used in a battery charger to monitor charging current to prevent overcharging. A sense resistor  $R_{SENSE}$  is connected to the battery directly. This system requires an op amp with rail-to-rail input. The LMV93x-N are ideal for this application because its common-mode input range extends up to the positive supply.

##### 8.2.1.2 Detailed Design Procedure

As seen in Figure 30, the  $I_{CHARGE}$  current flowing through sense resistor  $R_{SENSE}$  develops a voltage drop equal to  $V_{SENSE}$ . The voltage at the negative sense point will now be less than the positive sense point by an amount proportional to the  $V_{SENSE}$  voltage.

The low-bias currents of the LMV93x cause little voltage drop through  $R_2$ , so the negative input of the LMV93x amplifier is at essentially the same potential as the negative sense input.

The LMV93x will detect this voltage error between its inputs and servo the transistor base to conduct more current through Q1, increasing the voltage drop across  $R_1$  until the LMV93x inverting input matches the noninverting input. At this point, the voltage drop across  $R_1$  now matches  $V_{SENSE}$ .

$I_G$ , a current proportional to  $I_{CHARGE}$ , will flow according to the following relation:

$$I_G = V_{SENSE} / R_1 = (R_{SENSE} \cdot I_{CHARGE}) / R_1 \quad (2)$$

$I_G$  also flows through the gain resistor  $R_3$  developing a voltage drop equal to:

$$V_3 = I_G \cdot R_3 = (V_{SENSE} / R_1) \cdot R_3 = ((R_{SENSE} \cdot I_{CHARGE}) / R_1) \cdot R_3 \quad (3)$$

**Typical Applications (continued)**

$$V_{OUT} = (R_{SENSE} * I_{CHARGE}) * G$$

where

- $G = R_3 / R_1$  (4)

The other channel of the LMV93x may be used to buffer the voltage across R3 to drive the following stages.

**8.2.1.3 Application Curve**

Figure 31 shows the results of the example current sense circuit.

NOTE: the error after 4 V where transistor Q1 runs out of headroom and saturates, limiting the upper output swing.

**Figure 31. Current Sense Amplifier Results**

**8.2.2 Half-Wave Rectifier Applications**

**Figure 32. Half-Wave Rectifier With Rail-To-Ground Output Swing Referenced to Ground**

**Figure 33. Half-Wave Rectifier With Negative-Going Output Swing Referenced to V<sub>CC</sub>**

**LMV931-N, LMV931-N-Q1  
LMV932-N, LMV932-N-Q1, LMV934-N, LMV934-N-Q1**

SNOS993O –NOVEMBER 2001 –REVISED DECEMBER 2014

www.ti.com

**Typical Applications (continued)**

**8.2.2.1 Design Requirements**

Because the LMV931-N, LMV932-N, LMV934-N input common-mode range includes both positive and negative supply rails and the output can also swing to either supply, achieving half-wave rectifier functions in either direction is an easy task. All that is needed are two external resistors; there is no need for diodes or matched resistors. The half-wave rectifier can have either positive or negative going outputs, depending on the way the circuit is arranged.

**8.2.2.2 Detailed Design Procedure**

In Figure 32 the circuit is referenced to ground, while in Figure 33 the circuit is biased to the positive supply. These configurations implement the half-wave rectifier because the LMV93x-N can not respond to one-half of the incoming waveform. It can not respond to one-half of the incoming because the amplifier cannot swing the output beyond either rail therefore the output disengages during this half cycle. During the other half cycle, however, the amplifier achieves a half wave that can have a peak equal to the total supply voltage. R<sub>1</sub> should be large enough not to load the LMV93x-N.

**8.2.2.3 Application Curve**

Figure 34. Output of Ground-to-Rail Circuit

Figure 35. Output of Rail-to-Ground Circuit

**8.2.3 Instrumentation Amplifier With Rail-to-Rail Input and Output Application**

Figure 36. Rail-to-Rail Instrumentation Amplifier

**8.2.3.1 Design Requirements**

Using three of the LMV93x-N amplifiers, an instrumentation amplifier with rail-to-rail inputs and outputs can be made as shown in Figure 36.

**8.2.3.2 Detailed Design Procedure**

In this example, amplifiers on the left side act as buffers to the differential stage. These buffers assure that the input impedance is very high. They also assure that the difference amp is driven from a voltage source. This is necessary to maintain the CMRR set by the matching R<sub>1</sub>-R<sub>2</sub> with R<sub>3</sub>-R<sub>4</sub>. The gain is set by the ratio of R<sub>2</sub>/R<sub>1</sub> and R<sub>3</sub> should equal R<sub>1</sub> and R<sub>4</sub> equal R<sub>2</sub>. With both rail-to-rail input and output ranges, the input and output are only limited by the supply voltages. Remember that even with rail-to-rail outputs, the output can not swing past the supplies so the combined common-mode voltages plus the signal should not be greater than the supplies or limiting will occur.

**8.2.3.3 Application Curve**

Figure 37 shows the results of the instrumentation amplifier with R<sub>1</sub> and R<sub>3</sub> = 1 K, and R<sub>2</sub> and R<sub>4</sub> = 100 kΩ, for a gain of 100, running on a single 5-V supply with a input of V<sub>CM</sub> = V<sub>S</sub>/2. The combined effects of the individual offset voltages can be seen as a shift in the offset of the curve.

## Typical Applications (continued)

**Figure 37. Instrumentation Amplifier Output Results**

### 8.3 Dos and Don'ts

Do properly bypass the power supplies.

Do add series resistance to the output when driving capacitive loads, particularly cables, Muxes and ADC inputs.

Do add series current limiting resistors and external schottky clamp diodes if input voltage is expected to exceed the supplies. Limit the current to 1 mA or less (1 kΩ per volt).

## 9 Power Supply Recommendations

For proper operation, the power supplies must be properly decoupled. For decoupling the supply lines, TI recommends that 10-nF capacitors be placed as close as possible to the op amp power supply pins. For single-supply, place a capacitor between V<sup>+</sup> and V<sup>-</sup> supply leads. For dual supplies, place one capacitor between V<sup>+</sup> and ground, and one capacitor between V<sup>-</sup> and ground.

## 10 Layout

### 10.1 Layout Guidelines

The V<sup>+</sup> pin should be bypassed to ground with a low-ESR capacitor.

The optimum placement is closest to the V<sup>+</sup> and ground pins.

Take care to minimize the loop area formed by the bypass capacitor connection between V<sup>+</sup> and ground.

The ground pin should be connected to the PCB ground plane at the pin of the device.

The feedback components should be placed as close to the device as possible minimizing strays.

### 11.4 Trademarks

All trademarks are the property of their respective owners.

### 11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF LMV931-N, LMV931-N-Q1, LMV932-N, LMV932-N-Q1, LMV934-N, LMV934-N-Q1 :**

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer’s risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

### Products

Audio	<a href="http://www.ti.com/audio">www.ti.com/audio</a>
Amplifiers	<a href="http://amplifier.ti.com">amplifier.ti.com</a>
Data Converters	<a href="http://dataconverter.ti.com">dataconverter.ti.com</a>
DLP® Products	<a href="http://www.dlp.com">www.dlp.com</a>
