

FAN7554 Versatile PWM Controller

Features

- Current mode control
- Pulse-by-Pulse Current Limiting
- Low External Components
- Under-Voltage Lockout(UVLO): 9 V/15 V
- Stand-by Current: Typical: 100 μ A
- Power Saving Mode Current: Typical: 200 μ A
- Operating Current: Typical. 7 mA
- Soft-Start
- On/Off Control
- Overload Protection (OLP)
- Over-Voltage Protection (OVP)
- Over-Current Protection (OCP)
- Over-Current Limit (OCL)
- Operating Frequency up to 500 kHz
- 1 A Totem-Pole Output Current

Applications

- Off-Line & DC-DC Converter

Description

The FAN7554 is a fixed frequency current mode PWM controller. It is specially designed for off-line and DC to DC converter applications with minimal external components. These integrated circuits feature a trimmed oscillator for precise duty cycle control, a temperature compensated reference, an ON/OFF control, a high gain error amplifier, a current sensing comparator, and a high current totem-pole output. The FAN7554 has various protection functions such as an overload protection, an over-current protection, and the over-voltage protection, which include built-in auto restart circuit. The FAN7554 is available in the 8-DIP package.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Operation Description

The FAN7554 has all the basic features of the current mode SMPS control IC. Its basic configuration includes the UVLO with 6 V hysteresis, a band gap reference, the oscillator that can oscillate up to 500 kHz according to R_t/C_t (connected externally), a PWM logic circuit, a gate driver, and the feedback circuit that has the current source and soft start function. The FAN7554 has various functions such as an overload protection, an over current protection, and an over-voltage protection. The overload protection forces the FAN7554 to stop its operation if the load current is higher than the preset value. The protection circuit can also be prevented from operating during transient states by ensuring that a certain amount of the time passes before the protection circuit operates. The shutdown circuit is configured for an auto-restart, so the FAN7554 automatically restarts when V_{CC} drops to 9 V (stop voltage).

Startup

The startup circuit is made up of an Under-Voltage Lockout (UVLO), the protection for low voltage conditions, and the 5 V reference (V_{REF}), which supplies bias voltage to the control circuit after startup. The start voltage of the UVLO is 15 V, and the stop voltage after turn on is 9 V. It has a 6 V hysteresis. The minimum operating current for startup threshold is typically 100 μ A, and this can reduce the power dissipation on the startup resistor. The V_{REF} is composed of the band gap reference circuit with its superior temperature characteristics and supplies power to all the FAN7554 circuits and R_t/C_t , with the exceptions of the ULVO circuit and ON/OFF control circuit.

Figure 14. Low Current Startup & Bandgap Reference Circuit

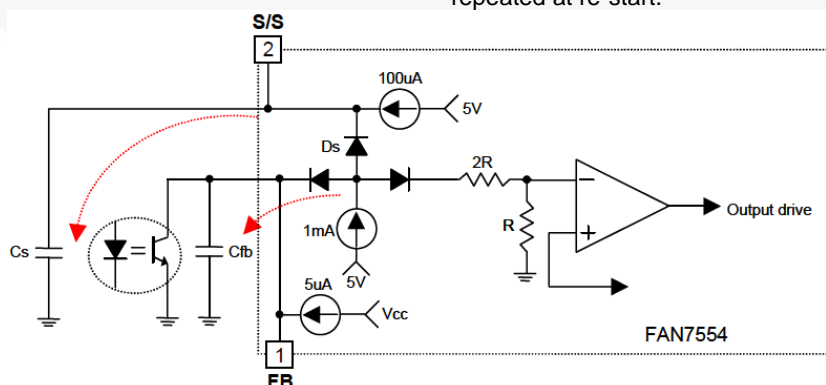

Figure 16. Soft Start Circuit & Circuit Flow

Figure 15. Startup & Circuit Characteristics

Soft Start

The SMPS output load usually contains a capacitive load component. During initial startup, the output voltage increases at a fixed time constant because of this component. If the feedback loop, which controls the output voltage, was to start without the soft-start circuit, the feedback loop would appear to be open during initial startup, so, at startup, the feedback voltage applied to the PWM comparator's inverting input (-) reaches its maximum value (1 V).

During this time, the peak value of the drain current would stay at the maximum value, and the maximum power would be delivered to the secondary load side from the start. When the maximum power is delivered to the secondary side for this initial fixed time, the entire circuit is seriously stressed. The use of a soft-start can avoid such stresses. At startup, the soft-start capacitor C_S is charged by 1 mA and 100 μ A current sources.

The voltage of the inverting terminal of the PWM comparator increases to 1/3 of the C_S voltage at a fixed time constant. Subsequently, the drain peak current is limited by the gradual increase in the C_S voltage and this causes the output voltage to increase smoothly. When the C_S voltage becomes greater than 3 V, the diode D_S turns off consequently, the feedback capacitor C_{FB} is charged by 1 mA and 5 μ A current sources. This charge voltage determines the comparator's inverting voltage. Then, C_S voltage charges to 5 V by 100 μ A current source. The soft start capacitor C_S is discharged when the UVLO good logic starts, so the soft start is repeated at re-start.

Oscillator

As shown in Figure 17, the oscillator frequency is programmed by values selected for timing components R_t and C_t . Capacitor C_t is charged to almost 2.8 V through resistor R_t from the 5 V reference and discharged to 1.2 V by an internal current source. The oscillator generates the clock signal while the timing capacitor C_t is discharged. The gate drive output becomes low during the clock time. R_t and C_t selection determine the oscillator frequency and maximum duty cycle. Charge and discharge times can be calculated through the equations below.

Charging Time: $t_c = 0.55 \times R_t \times C_t$

Discharging Time: $t_d = R_t \times C_t \times \ln[(0.0063 \times R_t - 2.8) / (0.0063 \times R_t - 3.8)]$

Where the oscillator frequency: $f_{osc} = (t_c + t_d)^{-1} (\pm 10\%)$.

When $R_t > 5 \text{ k}\Omega$, $f_{osc} = 1 / (0.55 \times R_t \times C_t) = 1.8 / (R_t \times C_t)$.

Figure 17. Oscillator Circuit

Figure 18. Sawtooth & Clock Waveform

Feedback

As shown in Figure 16, the internal oscillator clock turns on the MOSFET. The feedback comparator operates to turn it off again, when the MOSFET current reaches a set value proportional to V_{FB} . The feedback capacitor C_{FB} is charged by the internal current sources, 1 mA and 5 μ A, and is discharged by the secondary side photo-coupler to control the output voltage.

Figure 19. Feedback & PWM Circuit

Delayed Shutdown

During the normal operation, the feedback voltage is between 0~3 V. If the output terminal overloads or an error happens to the feedback loop, the delayed shutdown circuit operates. When the feedback voltage is less than 3 V, the feedback capacitor is charged by current sources, 1 mA and 5 μ A; when the feedback voltage becomes greater than 3 V, the capacitor is

charged by the 5 μ A current source because diode D1 turns off. When the feedback voltage is less than 3 V, the charge slope becomes an exponential function and, when it is greater than 3 V, the charge slope becomes linear. When the feedback voltage reaches almost 6 V, the FAN7554 shuts down. The shut down circuit is configured for auto-restart, so it automatically restarts when V_{CC} reaches the under voltage 9 V.

Figure 20. Delayed Shutdown & Feedback Circuit

Figure 21. Delayed Shutdown & Feedback Waveform

Gate Driver

The gate drive circuit has the totem-pole output configuration. The output has 1 A peak current and 200 mA average current drive ability.

1

The FAN7554 is able to use the feedback pin for ON/OFF control by placing NPN transistor between the cathode of the KA431 and ground as shown in Figure 23. When the transistor turns on, the current flows through the photo diode and saturates the photo transistor. As a result, the feedback voltage is dropped to zero. When the feedback voltage is below 0.3 V, the soft start voltage starts to discharge by connecting the internal resistor 1 k Ω in parallel with the external capacitor Cs. When the soft-start voltage becomes less than 1.5 V, all the blocks in the FAN7554 are turned off, with the exceptions of the UVLO block and ON/OFF control block. The operation current is about 200 μ A. So the stand-by power is reduced and SMPS efficiency is improved. When the feedback voltage exceeds 0.3 V, the FAN7554 normally operates by turning on V_{REF} block.

Figure 23. ON/OFF Control Circuit

Figure 24. ON-OFF Control Circuit Waveform

Protection Circuits

The FAN7554 has many built-in protection circuits that do not need additional components, providing reliability without cost increase. These protection circuits have the auto-restart configuration. In this configuration, the protection circuits reset when V_{CC} is below UVLO stop threshold (9 V) and restarts when V_{CC} is above UVLO start threshold voltage (15 V).

Over Voltage Protection

Abnormalities may occur in the SMPS secondary side feedback circuit. First, when the feedback pin is short to the ground, the feedback voltage is zero and the FAN7554 is unable to start switching. Second, when the feedback circuit is open, the secondary voltage generally becomes much greater than the rated voltage as the primary side continues to switch at the maximum current level. This may cause the blowing off the fuse or, in serious cases, fires. It is possible that the devices directly connected to the secondary output without a regulator could be destroyed. Even in these cases, the over voltage protection circuit operates. Since V_{CC} is proportional to the output, in an over voltage situation, it also will increase. In the FAN7554, the protection circuit operates when V_{CC} exceeds 34 V. Therefore, in normal operation, V_{CC} must be set below 34 V.

Overload Protection

An overload is the state in which the load is operating normally but in excess of the preset load. The overload protection circuit can force the FAN7554 to stop its operation. The protection can also operate in transient states such as initial SMPS operation. Because the transient state returns to the normal state after a fixed time, the protection circuit need not to operate during this time. That is, the FAN7554 needs the time to detect and decide whether it is an overload condition or not. The protection circuit can be prevented from operating during transient states by ensuring that a certain amount of time passes before the protection circuit operates. The above operations are executed as follows: Since the FAN7554 adopts a current mode, it is impossible for current to flow above a maximum level. For a fixed input voltage, this limits power. Therefore, if the power at the output exceeds this maximum, V_O , shown in Figure 25, becomes less than the set voltage, and the KA431 pulls in only the given minimum current. As a result, the photo-coupler's secondary side current becomes zero. The same goes for the photo-coupler's primary side current. Consequently, when the full current 1 mA flows through the internal resistor ($2R + R = 3R$), V_{FB} becomes approximately 3 V and from that time, the 5 μA current source begins to charge C_{FB} the photo-coupler's secondary current is almost zero. The FAN7554 shuts down when V_{FB} reaches 6 V.

AUTHORIZED USE

Unless otherwise specified in this data sheet, this product is a standard commercial product and is not intended for use in applications that require extraordinary levels of quality and reliability. This product may not be used in the following applications, unless specifically approved in writing by a Fairchild officer: (1) automotive or other transportation, (2) military/aerospace, (3) any safety critical application – including life critical medical equipment – where the failure of the Fairchild product reasonably would be expected to result in personal injury, death or property damage. Customer's use of this product is subject to agreement of this Authorized Use policy. In the event of an unauthorized use of Fairchild's product, Fairchild accepts no liability in the event of product failure. In other respects, this product shall be subject to Fairchild's Worldwide Terms and Conditions of Sale, unless a separate agreement has been signed by both Parties.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Terms of Use

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

PRODUCT STATUS DEFINITIONS

Definition of Terms

| Datasheet Identification | Product Status | Definition |
|--------------------------|-----------------------|---|
| Advance Information | Formative / In Design | Datasheet contains the design specifications for product development. Specifications may change in any manner without notice. |
| Preliminary | First Production | Datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design. |
| No Identification Needed | Full Production | Datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design. |
| Obsolete | Not In Production | Datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only. |
