Description

These Power MOSFETs have been developed using STMicroelectronics' unique STripFET process, which is specifically designed to minimize input capacitance and gate charge. This renders the devices suitable for use as primary switch in advanced high-efficiency isolated DC-DC converters for telecom and computer applications, and applications with low gate charge driving requirements.

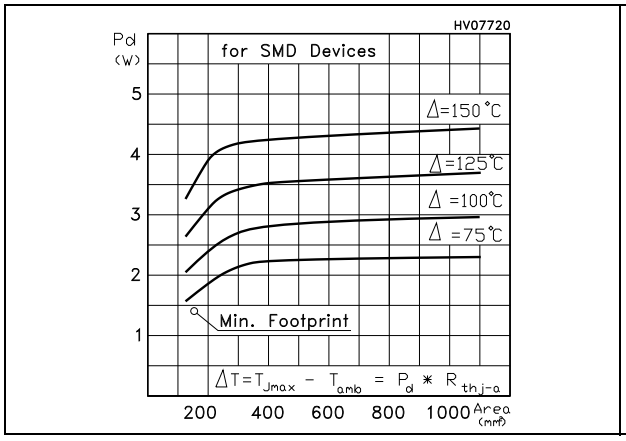

Figure 17. Safe operating area

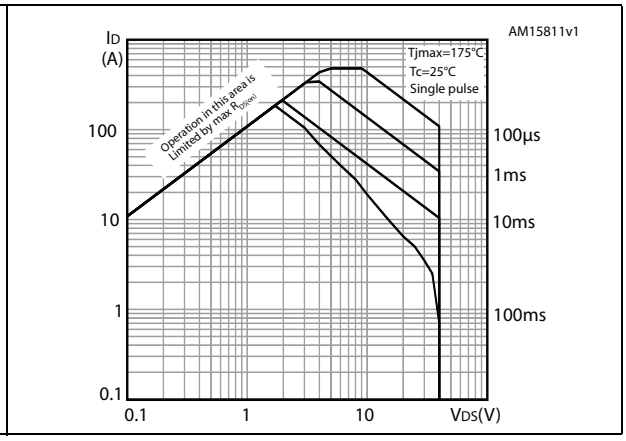

Figure 18. Allowable Iav vs. time in avalanche

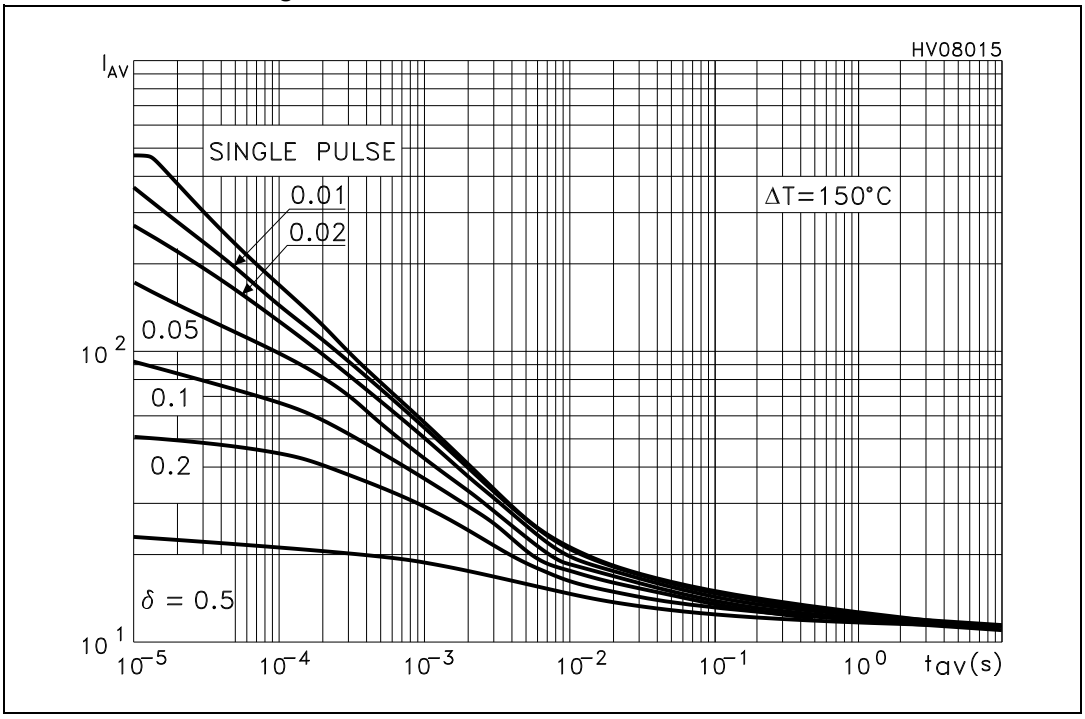

The previous curve give the safe operating area for unclamped inductive loads, single pulse or repetitive, under the following conditions:

$P_{D(AVE)} = 0.5*(1.3*BV_{DSS}*I_{AV})$

$E_{AS(AR)} = P_{D(AVE)} * t_{AV}$

Where:

I_{AV} is the allowable current in avalanche

$P_{D(AVE)}$ is the average power dissipation in avalanche (single pulse)

t_{AV} is the time in avalanche

To de rate above 25°C, at fixed I_{AV}, the following equation must be applied:

$I_{AV}=2*(T_{jmax} - T_{CASE}) / (1.3*BV_{DSS} * Z_{th})$

Where:

$Z_{th}= K*R_{th}$ is the value coming from normalized thermal response at fixed pulse width equal to T_{AV}
