## 1.8-V to 5-V DUAL UART WITH 16-BYTE FIFOS

### FEATURES

- Programmable Auto-RTS and Auto-CTS
- In Auto-CTS Mode, CTS Controls the Transmitter
- In Auto-RTS Mode, RCV FIFO Contents, and Threshold Control RTS
- Serial and Modem Control Outputs Drive a RJ11 Cable Directly When Equipment is on the Same Power Drop
- Capable of Running With All Existing TL16C450 Software
- After Reset, All Registers Are Identical to the TL16C450 Register Set
- Up to 24-MHz Clock Rate for up to 1.5-Mbaud Operation With  $V_{CC} = 5\text{ V}$
- Up to 20-MHz Clock Rate for up to 1.25-Mbaud Operation With  $V_{CC} = 3.3\text{ V}$
- Up to 16-MHz Clock Rate for up to 1-Mbaud Operation With  $V_{CC} = 2.5\text{ V}$
- Up to 10-MHz Clock Rate for up to 625-kbaud Operation With  $V_{CC} = 1.8\text{ V}$
- In the TL16C450 Mode, Hold and Shift Registers Eliminate the Need for Precise Synchronization Between the CPU and Serial Data
- Programmable Baud Rate Generator Allows Division of Any Input Reference Clock by 1 to ( $2^{16} - 1$ ) and Generates an Internal  $16 \times$  Clock
- Standard Asynchronous Communication Bits (Start, Stop, and Parity) Added to or Deleted From the Serial Data Stream
- 5-V, 3.3-V, 2.5-V, and 1.8 V Operation
- Independent Receiver Clock Input
- Transmit, Receive, Line Status, and Data Set Interrupts Independently Controlled
- Fully Programmable Serial Interface Characteristics:
  - 5-, 6-, 7-, or 8-Bit Characters
  - Even-, Odd-, or No-Parity Bit Generation and Detection
  - 1-, 1 ½-, or 2-Stop Bit Generation
  - Baud Generation (dc to 1 Mbit/s)

- False-Start Bit Detection
- Complete Status Reporting Capabilities
- 3-State Output TTL Drive Capabilities for Bidirectional Data Bus and Control Bus
- Line Break Generation and Detection
- Internal Diagnostic Capabilities:
  - Loopback Controls for Communications Link Fault Isolation
  - Break, Parity, Overrun, and Framing Error Simulation
- Fully Prioritized Interrupt System Controls
- Modem Control Functions ( $\overline{\text{CTS}}$ ,  $\overline{\text{RTS}}$ ,  $\overline{\text{DSR}}$ ,  $\overline{\text{DTR}}$ ,  $\overline{\text{RI}}$ , and  $\overline{\text{DCD}}$ )
- Available in 44-Pin PLCC (FN) or 32-Pin QFN (RHB) Packages
- Each UART's Internal Register Set May Be Written Concurrently to Save Setup Time
- Multi-Function Output ( $\overline{\text{MF}}$ ) Allows Users to Select Among Several Functions, Saving Package Pins

### APPLICATIONS

- Point-of-Sale Terminals
- Gaming Terminals
- Portable Applications
- Router Control
- Cellular Data
- Factory Automation

### DESCRIPTION

The TL16C2552 is a dual universal asynchronous receiver and transmitter (UART). It incorporates the functionality of two TL16C550D UARTs, each UART having its own register set and FIFOs. The two UARTs share only the data bus interface and clock source, otherwise they operate independently. Another name for the UART function is Asynchronous Communications Element (ACE), and these terms will be used interchangeably. The bulk of this document describes the behavior of each ACE, with the understanding that two such devices are incorporated into the TL16C2552.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## TL16C2552

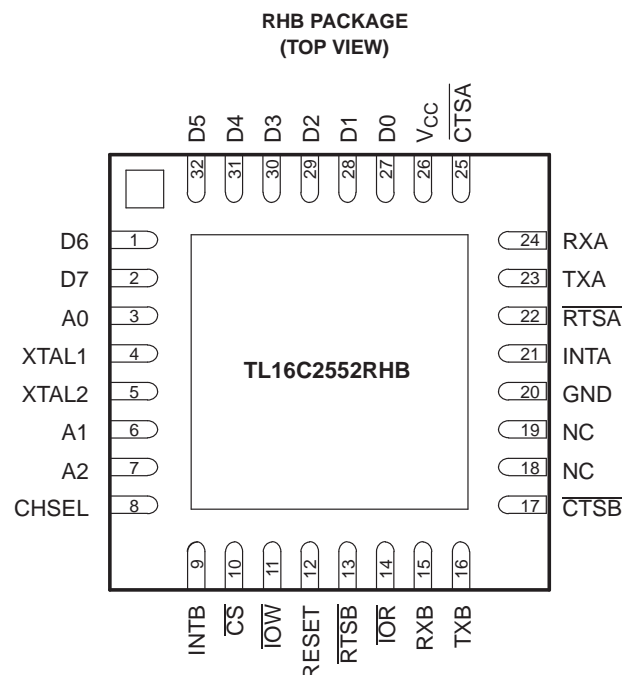

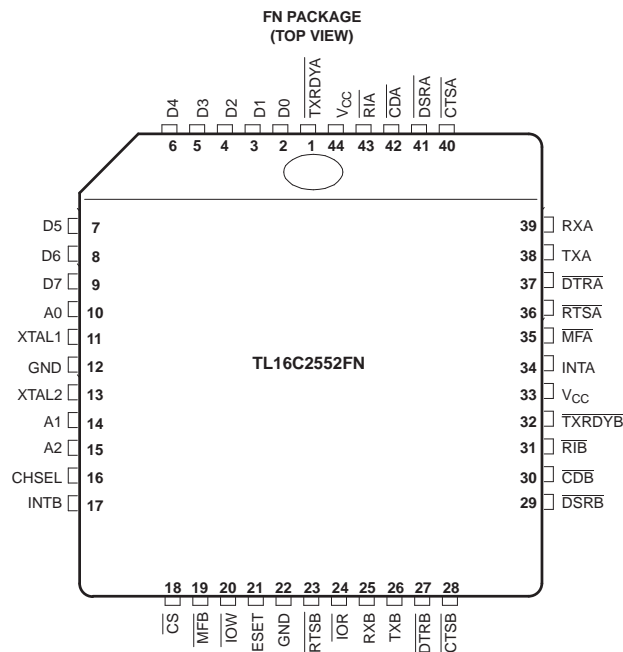

SLWS163A–SEPTEMBER 2005–REVISED JUNE 2006

Each ACE is a speed and voltage range upgrade of the TL16C550C, which in turn is a functional upgrade of the TL16C450. Functionally equivalent to the TL16C450 on power up or reset (single character or TL16C450 mode), each ACE can be placed in an alternate FIFO mode. This relieves the CPU of excessive software overhead by buffering received and to be transmitted characters. Each receiver and transmitter store up to 16 bytes in their respective FIFOs, with the receive FIFO including three additional bits per byte for error status. In the FIFO mode, a selectable autoflow control feature can significantly reduce software overhead and increase system efficiency by automatically controlling serial data flow using handshakes between the  $\overline{\text{RTS}}$  output and  $\overline{\text{CTS}}$  input, thus eliminating overruns in the receive FIFO.

Each ACE performs serial-to-parallel conversions on data received from a peripheral device or modem and stores the parallel data in its receive buffer or FIFO, and each ACE performs parallel-to-serial conversions on data sent from its CPU after storing the parallel data in its transmit buffer or FIFO. The CPU can read the status of either ACE at any time. Each ACE includes complete modem control capability and a processor interrupt system that can be tailored to the application.

Each ACE includes a programmable baud rate generator capable of dividing a reference clock with divisors of from 1 to 65535, thus producing a  $16\times$  internal reference clock for the transmitter and receiver logic. Each ACE accommodates up to a 1.5-Mbaud serial data rate (24-MHz input clock). As a reference point, that speed would generate a 667-ns bit time and a 6.7- $\mu\text{s}$  character time (for 8,N,1 serial data), with the internal clock running at 24 MHz.

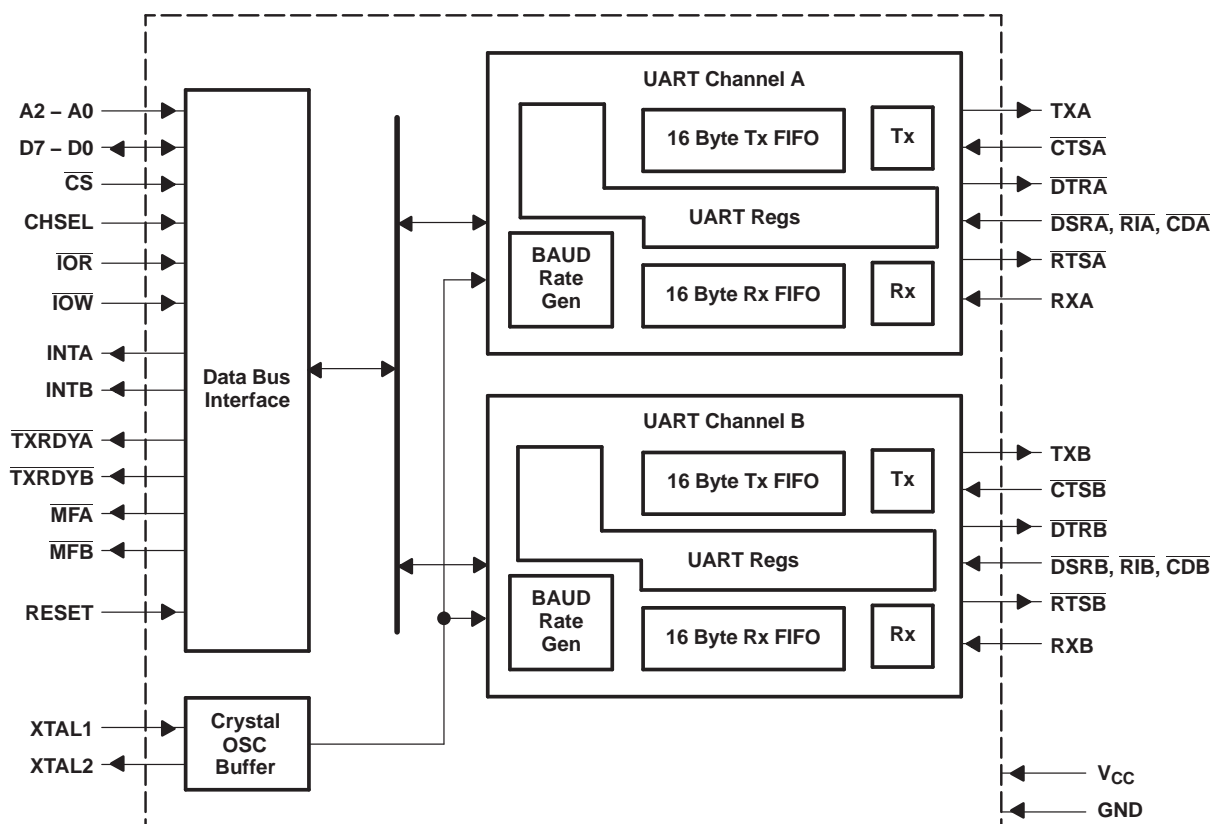

Each ACE has a  $\overline{\text{TXRDY}}$  and  $\overline{\text{RXRDY}}$  output that can be used to interface to a DMA controller.

NC – No internal connection

NOTE: The 32-pin RHB package does not provide access to  $\overline{\text{DSRA}}$ ,  $\overline{\text{DSRB}}$ ,  $\overline{\text{RIA}}$ ,  $\overline{\text{RIB}}$ ,  $\overline{\text{CDA}}$ ,  $\overline{\text{CDB}}$  inputs and  $\overline{\text{MFA}}$ ,  $\overline{\text{MFB}}$ ,  $\overline{\text{DTRA}}$ ,  $\overline{\text{DTRB}}$ ,  $\overline{\text{TXRDYA}}$ ,  $\overline{\text{TXRDYB}}$  outputs.

## TL16C2552 Block Diagram

A.  $\overline{MF}$  output allows selection of  $\overline{OP}$ ,  $\overline{BAUDOUT}$ , or  $\overline{RXRDY}$  per channel.

## DEVICE INFORMATION

### TERMINAL FUNCTIONS

| TERMINAL                              |        |         | I/O | DESCRIPTION   |
|---------------------------------------|--------|---------|-----|---|
| NAME                                  | FN NO. | RHB NO. |     |   |
| A0                                    | 10     | 3       | I   | Address 0 select bit. Internal registers address selection  |
| A1                                    | 14     | 6       | I   | Address 1 select bit. Internal registers address selection  |
| A2                                    | 15     | 7       | I   | Address 2 select bit. Internal registers address selection  |
| $\overline{CDA}$ , $\overline{CDB}$   | 42, 30 | –       | I   | Carrier detect (active low). These inputs are associated with individual UART channels A and B. A low on these pins indicates that a carrier has been detected by the modem for that channel. The state of these inputs is reflected in the modem status register (MSR).  |
| CHSEL                                 | 16     | 8       | I   | Channel select. UART channel A or B is selected by the state of this pin when $\overline{CS}$ is a logic 0. A logic 0 on the CHSEL selects the UART channel B while a logic 1 selects UART channel A. CHSEL could just be an address line from the user CPU such as A3. Bit 0 of the alternate function register (AFR) can temporarily override CHSEL function, allowing the user to write to both channel register simultaneously with one write cycle when $\overline{CS}$ is low. It is especially useful during the initialization routine. |
| $\overline{CS}$                       | 18     | 10      | I   | UART chip select (active low). This pin selects channel A or B in accordance with the state of the CHSEL pin. This allows data to be transferred between the user CPU and the 2552.   |
| $\overline{CTSA}$ , $\overline{CTSB}$ | 40, 28 | 25, 17  | I   | Clear to send (active low). These inputs are associated with individual UART channels A and B. A logic low on the CTS pins indicates the modem or data set is ready to accept transmit data from the 2552. Status can be tested by reading MSR bit 4. These pins only affect the transmit and receive operations when auto CTS function is enabled through the enhanced feature register (EFR) bit 7, for hardware flow control operation.  |

## DEVICE INFORMATION (continued)

### TERMINAL FUNCTIONS (continued)

| TERMINAL   |                |                     | I/O | DESCRIPTION   |
|--|----------------|---------------------|-----|---|
| NAME   | FN NO.         | RHB NO.             |     |   |
| D0-D4<br>D5-D7   | 2 - 6<br>7 - 9 | 27 - 31<br>32, 1, 2 | I/O | Data bus (bidirectional). These pins are the eight bit, 3-state data bus for transferring information to or from the controlling CPU. D0 is the least significant bit and the first data bit in a transmit or receive serial data stream.   |
| $\overline{\text{DSRA}}$ ,<br>$\overline{\text{DSRB}}$     | 41, 29         | —                   | I   | Data set ready (active low). These inputs are associated with individual UART channels A and B. A logic low on these pins indicates the modem or data set is powered on and is ready for data exchange with the UART. The state of these inputs is reflected in the modem status register (MSR).  |
| $\overline{\text{DTRA}}$ ,<br>$\overline{\text{DTRB}}$     | 37, 27         | —                   | O   | Data terminal ready (active low). These outputs are associated with individual UART channels A and B. A logic low on these pins indicates that the TL16C2552 is powered on and ready. These pins can be controlled through the modem control register. Writing a 1 to MCR bit 0 sets the $\overline{\text{DTR}}$ output to low, enabling the modem. The output of these pins is high after writing a 0 to MCR bit 0, or after a reset.  |
| GND  | 12, 22         | 20                  |     | Signal and power ground.  |
| INTA, INTB   | 34, 17         | 21, 9               | O   | Interrupt A and B (active high). These pins provide individual channel interrupts, INT A and B. INT A and B are enabled when MCR bit 3 is set to a logic 1, interrupt sources are enabled in the interrupt enable register (IER). Interrupt conditions include: receiver errors, available receiver buffer data, available transmit buffer space or when a modem status flag is detected. INTA-B are in the high-impedance state after reset.   |
| $\overline{\text{IOR}}$                                    | 24             | 14                  | I   | Read input (active low strobe). A high to low transition on $\overline{\text{IOR}}$ will load the contents of an internal register defined by address bits A0-A2 onto the TL16C2552 data bus (D0-D7) for access by an external CPU.   |
| $\overline{\text{IOW}}$                                    | 20             | 11                  | I   | Write input (active low strobe). A low to high transition on $\overline{\text{IOW}}$ will transfer the contents of the data bus (D0-D7) from the external CPU to an internal register that is defined by address bits A0-A2 and $\overline{\text{CSA}}$ and $\overline{\text{CSB}}$   |
| NC   | —              | 18, 19              |     | No internal connection  |
| $\overline{\text{MFA}}$ , $\overline{\text{MFB}}$          | 35, 19         | —                   | O   | Multi-function output. This output pin can function as the $\overline{\text{OP}}$ , $\overline{\text{BAUDOUT}}$ , or $\overline{\text{RXRDY}}$ pin. One of these output signal functions can be selected by the user programmable bits 1-2 of the alternate function register (AFR). These signal functions are described as follows: <ol style="list-style-type: none"> <li><math>\overline{\text{OP}}</math> - When <math>\overline{\text{OP}}</math> (active low) is selected, the <math>\overline{\text{MF}}</math> pin is a logic 0 when MCR bit 3 is set to a logic 1 (see MCR bit 3). MCR bit 3 defaults to a logic 1 condition after a reset or power-up.</li> <li><math>\overline{\text{BAUDOUT}}</math> - When <math>\overline{\text{BAUDOUT}}</math> function is selected, the 16x baud rate clock output is available at this pin.</li> <li><math>\overline{\text{RXRDY}}</math> - <math>\overline{\text{RXRDY}}</math> (active low) is intended for monitoring DMA data transfers.</li> </ol> If it is not used, leave it unconnected. |
| RESET  | 21             | 12                  | I   | Reset. RESET will reset the internal registers and all the outputs. The UART transmitter output and the receiver input will be disabled during reset time. See TL16C2552 external reset conditions for initialization details. RESET is an active-high input.   |
| RIA, RIB   | 43, 31         | —                   | I   | Ring indicator (active low). These inputs are associated with individual UART channels A and B. A logic low on these pins indicates the modem has received a ringing signal from the telephone line. A low to high transition on these input pins generates a modem status interrupt, if enabled. The state of these inputs is reflected in the modem status register (MSR)   |
| $\overline{\text{RTSA}}$ ,<br>$\overline{\text{RTSB}}$     | 36, 23         | 22, 13              | O   | Request to send (active low). These outputs are associated with individual UART channels A and B. A low on the $\overline{\text{RTS}}$ pin indicates the transmitter has data ready and waiting to send. Writing a 1 in the modem control register (MCR bit 1) sets these pins to low, indicating data is available. After a reset, these pins are set to high. These pins only affects the transmit and receive operation when auto $\overline{\text{RTS}}$ function is enabled through the enhanced feature register (EFR) bit 6, for hardware flow control operation.  |
| RXA, RXB   | 39, 25         | 24, 15              | I   | Receive data input. These inputs are associated with individual serial channel data to the 2552. During the local loopback mode, these RX input pins are disabled and TX data is internally connected to the UART RX input internally.  |
| TXA, TXB   | 38, 26         | 23, 16              | O   | Transmit data. These outputs are associated with individual serial transmit channel data from the 2552. During the local loopback mode, the TX input pin is disabled and TX data is internally connected to the UART RX input.  |
| $\overline{\text{TXRDYA}}$ ,<br>$\overline{\text{TXRDYB}}$ | 1, 32          | —                   | O   | Transmit ready (active low). $\overline{\text{TXRDY}}$ A and B go low when there are at least a trigger level numbers of spaces available. They go high when the TX buffer is full.   |
| V <sub>CC</sub>  | 33, 44         | 26                  | I   | Power supply inputs.  |

## DEVICE INFORMATION (continued)

### TERMINAL FUNCTIONS (continued)

| TERMINAL |        |         | I/O | DESCRIPTION   |
|----------|--------|---------|-----|---|
| NAME     | FN NO. | RHB NO. |     |   |
| XTAL1    | 11     | 4       | I   | Crystal or external clock input. XTAL1 functions as a crystal input or as an external clock input. A crystal can be connected between XTAL1 and XTAL2 to form an internal oscillator circuit (see Figure 5). Alternatively, an external clock can be connected to XTAL1 to provide custom data rates. |
| XTAL2    | 13     | 5       | O   | Output of the crystal oscillator or buffered clock. See also XTAL1. XTAL2 is used as a crystal oscillator output or buffered a clock output.  |

## Detailed Description

### Autoflow Control (see Figure 1)

Autoflow control is comprised of auto- $\overline{\text{CTS}}$  and auto- $\overline{\text{RTS}}$ . With auto- $\overline{\text{CTS}}$ , the  $\overline{\text{CTS}}$  input must be active before the transmitter FIFO can emit data. With auto- $\overline{\text{RTS}}$ ,  $\overline{\text{RTS}}$  becomes active when the receiver needs more data and notifies the sending serial device. When  $\overline{\text{RTS}}$  is connected to  $\overline{\text{CTS}}$ , data transmission does not occur unless the receiver FIFO has space for the data; thus, overrun errors are eliminated using ACE1 and ACE2 from a TLC16C2552 with the autoflow control enabled. If not, overrun errors occur when the transmit data rate exceeds the receiver FIFO read latency.

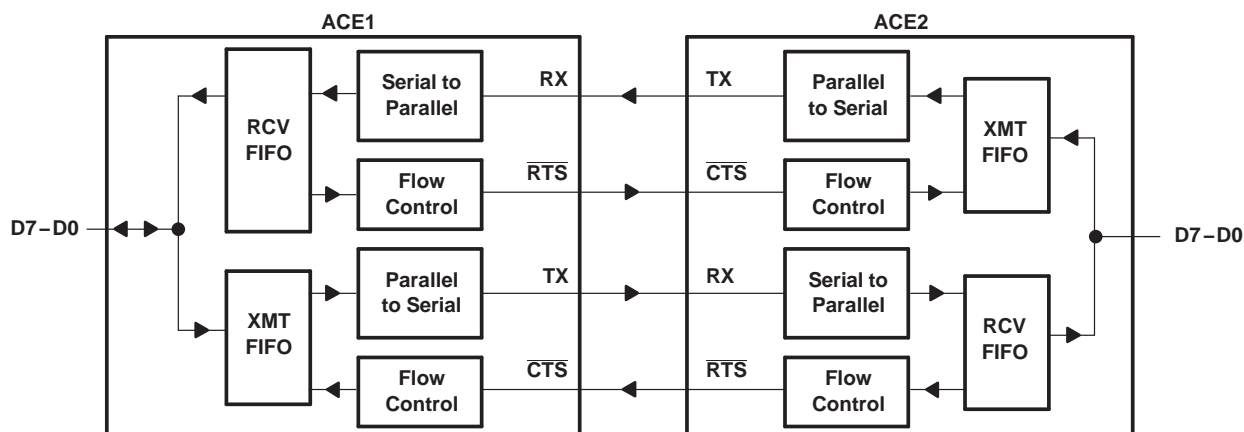

Figure 1. Autoflow Control (Auto- $\overline{\text{RTS}}$  and Auto- $\overline{\text{CTS}}$ ) Example

### Auto- $\overline{\text{RTS}}$ (See Figure 2 and Figure 3)

Auto- $\overline{\text{RTS}}$  data flow control originates in the receiver timing and control block (see functional block diagram) and is linked to the programmed receiver FIFO trigger level. When the receiver FIFO level reaches a trigger level of 1, 4, or 8 (see Figure 3),  $\overline{\text{RTS}}$  is deasserted. With trigger levels of 1, 4, and 8, the sending ACE may send an additional byte after the trigger level is reached (assuming the sending ACE has another byte to send) because it may not recognize the deassertion of  $\overline{\text{RTS}}$  until after it has begun sending the additional byte.  $\overline{\text{RTS}}$  is automatically reasserted once the RCV FIFO is emptied by reading the receiver buffer register.

When the trigger level is 14 (see Figure 5),  $\overline{\text{RTS}}$  is deasserted after the first data bit of the 16th character is present on the RX line.  $\overline{\text{RTS}}$  is reasserted when the RCV FIFO has at least one available byte space.

## TL16C2552

SLWS163A–SEPTEMBER 2005–REVISED JUNE 2006

### Auto- $\overline{\text{CTS}}$ (See Figure 2)

The transmitter circuitry checks  $\overline{\text{CTS}}$  before sending the next data byte. When  $\overline{\text{CTS}}$  is active, it sends the next byte. To stop the transmitter from sending the following byte,  $\overline{\text{CTS}}$  must be released before the middle of the last stop bit that is currently being sent (see Figure 2). The auto- $\overline{\text{CTS}}$  function reduces interrupts to the host system. When flow control is enabled,  $\overline{\text{CTS}}$  level changes do not trigger host interrupts because the device automatically controls its own transmitter. Without auto- $\overline{\text{CTS}}$ , the transmitter sends any data present in the transmit FIFO and a receiver overrun error may result.

### Enabling Autoflow Control and Auto- $\overline{\text{CTS}}$

Autoflow control is enabled by setting modem control register bits 5 (autoflow enable or AFE) and 1 ( $\overline{\text{RTS}}$ ) to a 1. Autoflow incorporates both auto- $\overline{\text{RTS}}$  and auto- $\overline{\text{CTS}}$ . When only auto- $\overline{\text{CTS}}$  is desired, bit 1 in the modem control register should be cleared (this assumes that a control signal is driving  $\overline{\text{CTS}}$ ).

### Auto- $\overline{\text{CTS}}$ and Auto- $\overline{\text{RTS}}$ Functional Timing

Figure 2.  $\overline{\text{CTS}}$  Functional Timing Waveforms

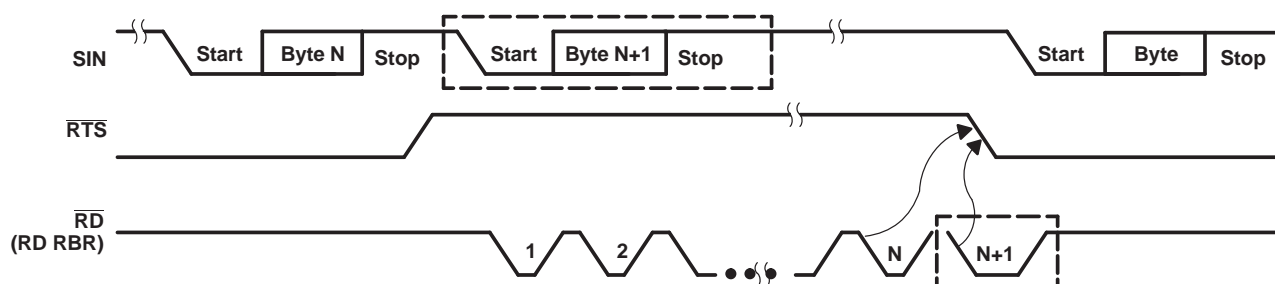

Figure 3.  $\overline{\text{RTS}}$  Functional Timing Waveforms, RCV FIFO Trigger Level = 1, 4, or 8 Bytes

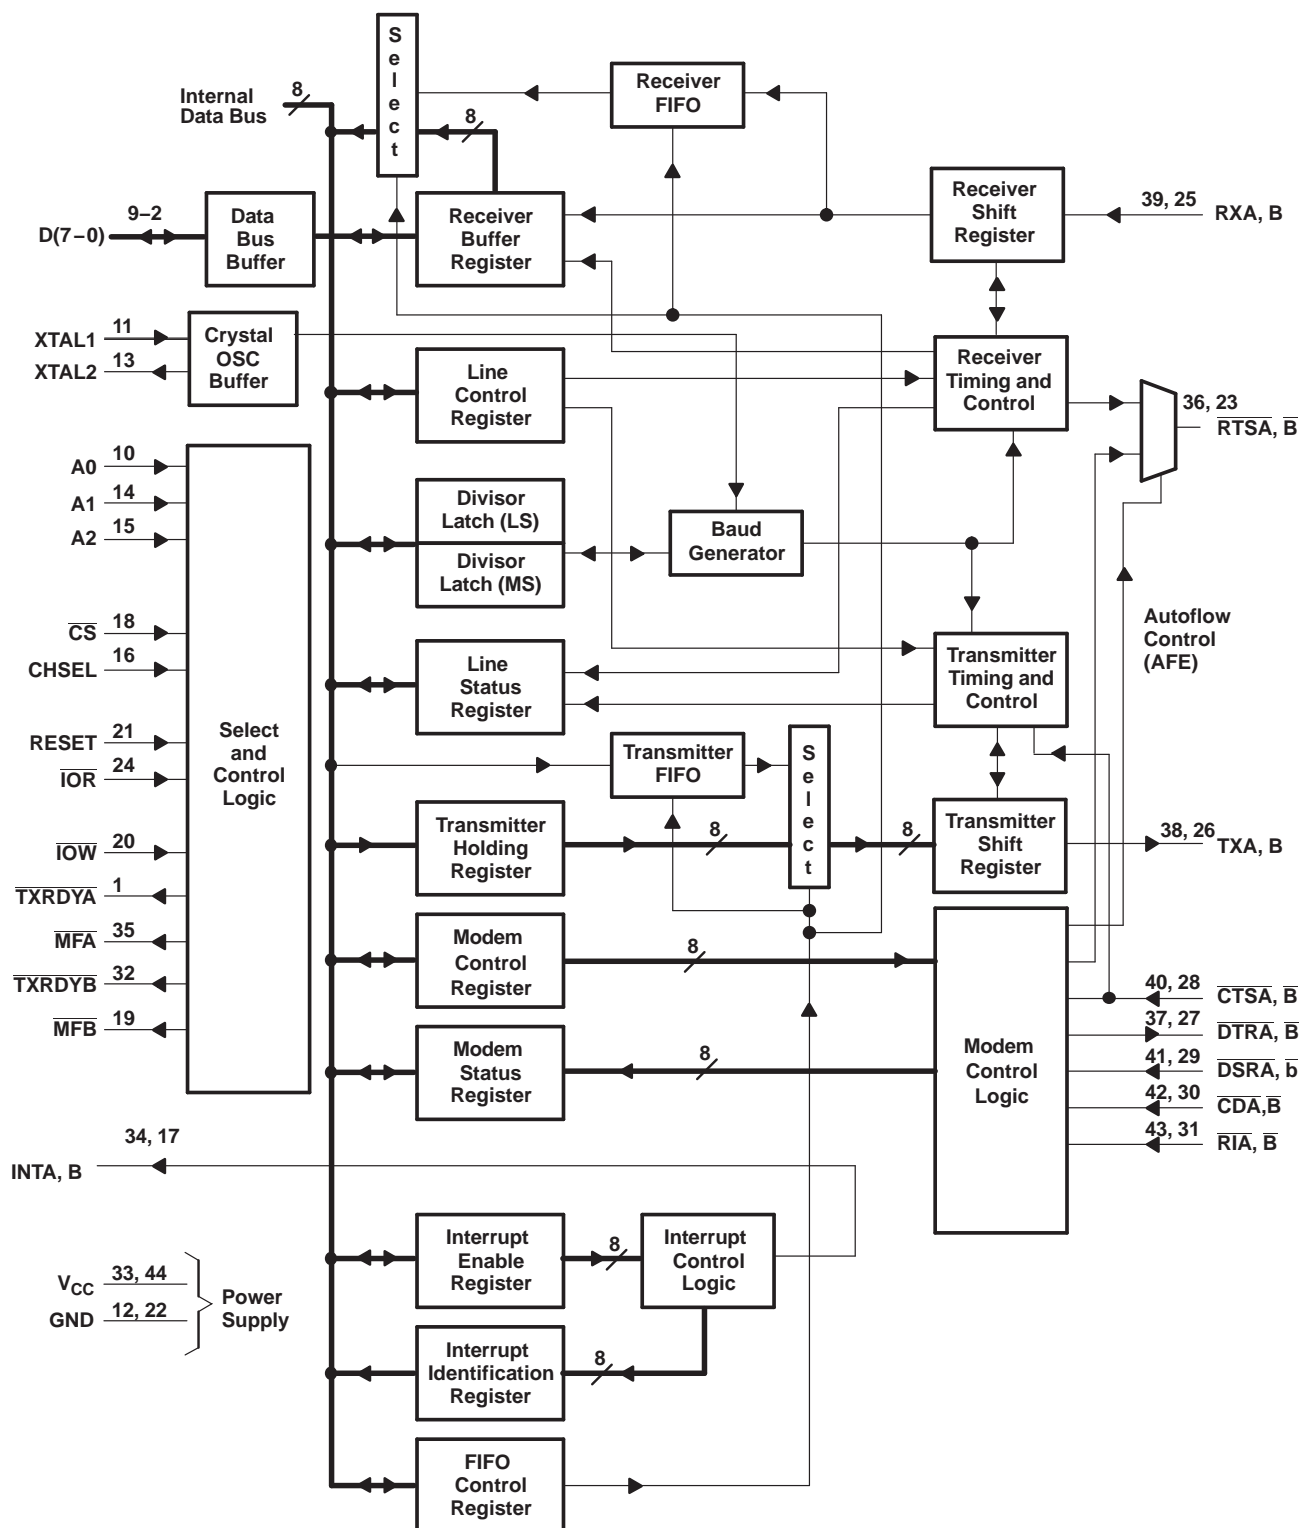

Figure 4.  $\overline{\text{RTS}}$  Functional Timing Waveforms, RCV FIFO Trigger Level = 14 Bytes

A. Pin numbers shown are for 44-pin PLCC FN package.

**Figure 5. Functional Block Diagram**

SLWS163A–SEPTEMBER 2005–REVISED JUNE 2006

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

|  | UNIT           |
|--|----------------|
| Supply voltage range, $V_{CC}$ <sup>(2)</sup>                | -0.5 V to 7 V  |
| Input voltage range at any input, $V_I$                      | -0.5 V to 7 V  |
| Output voltage range, $V_O$                                  | -0.5 V to 7 V  |
| Operating free-air temperature, $T_A$ , TL16C2552            | 0°C to 70°C    |
| Operating free-air temperature, $T_A$ , TL16C2552I           | -40°C to 85°C  |
| Storage temperature range, $T_{stg}$                         | -65°C to 150°C |
| Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds | 260°C          |

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to  $V_{SS}$ .

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

| 1.8 V $\pm 10\%$ |   | MIN  | NOM | MAX      | UNIT |
|------------------|---|------|-----|----------|------|
| $V_{CC}$         | Supply voltage                          | 1.62 | 1.8 | 1.98     | V    |

## TL16C2552

SLWS163A–SEPTEMBER 2005–REVISED JUNE 2006

### RECEIVER SWITCHING CHARACTERISTICS

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) <sup>(1)</sup>

| PARAMETER        |  | ALT. SYMBOL       | FIGURE           | TEST CONDITIONS        | LIMITS |     |       |     |       |     |     |                               | UNIT |
|------------------|--|-------------------|------------------|------------------------|--------|-----|-------|-----|-------|-----|-----|-------------------------------|------|
|                  |  |                   |                  |                        | 1.8 V  |     | 2.5 V |     | 3.3 V |     | 5 V |                               |      |
|                  |  |                   |                  |                        | MIN    | MAX | MIN   | MAX | MIN   | MAX | MIN | MAX                           |      |
| t <sub>d12</sub> | Delay time, RCLK to sample   | t <sub>SCD</sub>  | 9                |                        | 20     |     | 15    |     | 10    |     | 10  | ns                            |      |
| t <sub>d13</sub> | Delay time, stop to set INT or read RBR to LSI interrupt or stop to RXRDY↓ | t <sub>SINT</sub> | 8, 9, 10, 11, 12 |                        | 1      |     | 1     |     | 1     |     | 1   | RCLK cycle                    |      |
| t <sub>d14</sub> | Delay time, read RBR/LSR to reset INT                                      | t <sub>RINT</sub> | 8, 9, 10, 11, 12 | C <sub>L</sub> = 30 pF | 100    |     | 90    |     | 80    |     | 70  | ns                            |      |
| t <sub>d26</sub> | Delay time, RCV threshold byte to RTS↑                                     |                   | 19               | C <sub>L</sub> = 30 pF |        |     |       |     |       |     | 2   | baudout cycles <sup>(2)</sup> |      |
| t <sub>d27</sub> | Delay time, read of last byte in receive FIFO to RTS↓                      |                   | 19               | C <sub>L</sub> = 30 pF |        |     |       |     |       |     | 2   | baudout cycles                |      |
| t <sub>d28</sub> | Delay time, first data bit of 16th character to RTS↑                       |                   | 20               | C <sub>L</sub> = 30 pF |        |     |       |     |       |     | 2   | baudout cycles                |      |
| t <sub>d29</sub> | Delay time, RBRRD low to RTS↓  |                   | 20               | C <sub>L</sub> = 30 pF |        |     |       |     |       |     | 2   | baudout cycles                |      |

(1) In the FIFO mode, the read cycle (RC) = 1 baudclock (min) between reads of the receive FIFO and the status registers (interrupt identification register or line status register).

(2) A baudout cycle is equal to the period of the input clock divided by the programmed divider in DLL, DLM.

### TRANSMITTER SWITCHING CHARACTERISTICS

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

| PARAMETER        |   | ALT. SYMBOL      | FIGURE | TEST CONDITIONS        | LIMITS |     |       |     |       |     |     |     | UNIT           |

### PRINCIPLES OF OPERATION

#### Register Selection

**Table 1. Register Selection**

| DLAB <sup>(1)</sup> | A2 | A1 | A0 | REGISTER   |
|---------------------|----|----|----|--|
| 0                   | L  | L  | L  | Receiver buffer (read), transmitter holding register (write) |
| 0                   | L  | L  | H  | Interrupt enable register                                    |
| 0                   | L  | H  | L  | Interrupt identification register (read only)                |
| 0                   | L  | H  | L  | FIFO control register (write)                                |
| X                   | L  | H  | H  | Line control register  |
| X                   | H  | L  | L  | Modem control register                                       |
| X                   | H  | L  | H  | Line status register   |
| X                   | H  | H  | L  | Modem status register  |
| X                   | H  | H  | H  | Scratch register   |
| 1                   | L  | L  | L  | Divisor latch (LSB)  |
| 1                   | L  | L  | H  | Divisor latch (MSB)  |
| 1                   | L  | H  | L  | Alternate function register (AFR)                            |

(1) The divisor latch access bit (DLAB) is the most significant bit of the line control register. The DLAB signal is controlled by writing to this bit location (see [Table 4](#)).

**Table 2. ACE Reset Functions**

| REGISTER/SIGNAL  | RESET CONTROL        | RESET STATE  |
|--|----------------------|--|
| Interrupt enable register                                | Master reset         | All bits cleared (0 - 3 forced and 4 - 7 permanent)                                      |
| Interrupt identification register                        | Master reset         | Bit 0 is set, bits 1, 2, 3, 6, and 7 are cleared, and bits 4 - 5 are permanently cleared |
| FIFO control register                                    | Master reset         | All bits cleared   |
| Line control register                                    | Master reset         | All bits cleared   |
| Modem control register                                   | Master reset         | All bits, except bit 3, cleared (6 - 7 permanent), MCR 3 set                             |
| Line status register                                     | Master reset         | Bits 5 and 6 are set; all other bits are cleared   |
| Modem status register                                    | Master reset         | Bits 0 - 3 are cleared; bits 4 - 7 are input signals                                     |
| TX   | Master reset         | High   |
| INT  | Master reset MCR3    | Output buffer enabled  |
| Interrupt condition (receiver error flag)                | Read LSR/MR          | Low  |
| Interrupt condition (received data available)            | Read RBR/MR          | Low  |
| Interrupt condition (transmitter holding register empty) | Read IR/write THR/MR | Low  |
| Interrupt condition (modem status changes)               | Read MSR/MR          | Low  |
| $\overline{OP}$  | Master reset         | Low  |
| RTS  | Master reset         | High   |
| $\overline{DTR}$   | Master reset         | High   |
| Scratch register   | Master reset         | No effect  |
| Divisor latch (LSB and MSB) registers                    | Master reset         | No effect  |
| Receiver buffer register                                 | Master reset         | No effect  |
| Transmitter holding register                             | Master reset         | No effect  |
| RCVR FIFO  | MR/FCR1 - FCR0/DFCR0 | All bits cleared   |
| XMIT FIFO  | MR/FCR2 - FCR0/DFCR0 | All bits cleared   |
| Alternate function register (AFR)                        | Master reset         | All bits cleared   |

## Accessible Registers

The system programmer, using the CPU, has access to and control over any of the ACE registers that are summarized in [Table 2](#). These registers control ACE operations, receive data, and transmit data. Descriptions of these registers follow [Table 3](#).

**Table 3. Summary of Accessible Registers**

| BIT NO. | REGISTER ADDRESS                     |   |   |                                       |                                    |                                 |                               |                                     |                                     |                  |                     |                     |                             |
|---------|--------------------------------------|---|---|---------------------------------------|------------------------------------|---------------------------------|-------------------------------|-------------------------------------|-------------------------------------|------------------|---------------------|---------------------|-----------------------------|
|         | DLAB = 0                             |   |   |                                       |                                    |                                 |                               |                                     |                                     |                  | DLAB = 1            |                     |                             |

(1) Bit 0 is the least significant bit. It is the first bit serially transmitted or received.

(2) These bits are always 0 in the TL16C450 mode.

## FIFO Control Register (FCR)

The FCR is a write-only register at the same location as the IIR, which is a read-only register. The FCR enables and clears the FIFOs, sets the receiver FIFO trigger level, and selects the type of DMA signaling.

- Bit 0: This bit, when set, enables the transmitter and receiver FIFOs. Bit 0 must be set when other FCR bits are written to or they are not programmed. Changing this bit clears the FIFOs.
- Bit 1: This bit, when set, clears all bytes in the receiver FIFO and clears its counter. The shift register is not cleared. The 1 that is written to this bit position is self-clearing.
- Bit 2: This bit, when set, clears all bytes in the transmit FIFO and clears its counter. The shift register is not cleared. The 1 that is written to this bit position is self-clearing.
- Bit 3: When FCR0 is set, setting FCR3 causes  $\overline{\text{RXRDY}}$  and  $\overline{\text{TXRDY}}$  to change from level 0 to level 1.
- Bits 4 and 5: These two bits are reserved for future use.
- Bits 6 and 7: These two bits set the trigger level for the receiver FIFO interrupt (see [Table 4](#)).

## TL16C2552

SLWS163A—SEPTEMBER 2005—REVISED JUNE 2006

**Table 4. Receiver FIFO Trigger Level**

| BIT 7 | BIT 6 | RECEIVER FIFO TRIGGER LEVEL (BYTES) |
|-------|-------|-------------------------------------|
| 0     | 0     | 01                                  |
| 0     | 1     | 04                                  |
| 1     | 0     | 08                                  |
| 1     | 1     | 14                                  |

### FIFO Interrupt Mode Operation

When the receiver FIFO and receiver interrupts are enabled (FCR0 = 1, IER0 = 1, IER2 = 1), a receiver interrupt occurs as follows:

1. The received data available interrupt is issued to the microprocessor when the FIFO has reached its programmed trigger level. It is cleared when the FIFO drops below its programmed trigger level.
2. The IIR receive data available indication also occurs when the FIFO trigger level is reached, and like the interrupt, it is cleared when the FIFO drops below the trigger level.
3. The receiver line status interrupt (IIR = 06) has higher priority than the received data available (IIR = 04) interrupt.
4. The data ready bit (LSR0) is set when a character is transferred from the shift register to the receiver FIFO. It is cleared when the FIFO is empty.

When the receiver FIFO and receiver interrupts are enabled:

1. FIFO time-out interrupt occurs if the following conditions exist:
  - a. At least one character is in the FIFO.
  - b. The most recent serial character was received more than four continuous character times ago (if two stop bits are programmed, the second one is included in this time delay).
  - c. The most recent microprocessor read of the FIFO has occurred more than four continuous character times before. This causes a maximum character received command to interrupt an issued delay of 160 ms at a 300-baud rate with a 12-bit character.
2. Character times are calculated by using the RCLK input for a clock signal (makes the delay proportional to the baud rate).
3. When a time-out interrupt has occurred, it is cleared and the timer is cleared when the microprocessor reads one character from the receiver FIFO.
4. When a time-out interrupt has not occurred, the time-out timer is cleared after a new character is received or after the microprocessor reads the receiver FIFO.

When the transmitter FIFO and THRE interrupt are enabled (FCR0 = 1, IER1 = 1), transmit interrupts occur as follows:

1. The transmitter holding register empty interrupt [IIR (3 -0) = 2] occurs when the transmit FIFO is empty. It is cleared [IIR (3 -0) = 1] when the THR is written to (1 to 16 characters may be written to the transmit FIFO while servicing this interrupt) or the IIR is read.
2. The transmitter holding register empty interrupt is delayed one character time minus the last stop bit time when there have not been at least two bytes in the transmitter FIFO at the same time since the last time that the FIFO was empty. The first transmitter interrupt after changing FCR0 is immediate if it is enabled.

### FIFO Polled Mode Operation

With FCR0 = 1 (transmitter and receiver FIFOs enabled), clearing IER0, IER1, IER2, IER3, or all four to 0 puts the ACE in the FIFO polled mode of operation. Because the receiver and transmitter are controlled separately, either one or both can be in the polled mode of operation.

In this mode, the user program checks receiver and transmitter status using the LSR. As stated previously:

- LSR0 is set as long as one byte is in the receiver FIFO.
- LSR1 - LSR 4 specify which error(s) have occurred. Character error status is handled the same way as when in the interrupt mode; the IIR is not affected since IER2 = 0.
- LSR5 indicates when the THR is empty.
- LSR6 indicates that both the THR and TSR are empty.

- LSR7 indicates whether any errors are in the receiver FIFO.  
 There is no trigger level reached or time-out condition indicated in the FIFO polled mode. However, the receiver and transmitter FIFOs are still fully capable of holding characters.

### Interrupt Enable Register (IER)

The IER enables each of the five types of interrupts (see Table 5) and enables INTRPT in response to an interrupt generation. The IER can also disable the interrupt system by clearing bits 0 through 3. The contents of this register are summarized in Table 3 and are described in the following bullets.

- Bit 0: When set, this bit enables the received data available interrupt.
- Bit 1: When set, this bit enables the THRE interrupt.
- Bit 2: When set, this bit enables the receiver line status interrupt.
- Bit 3: When set, this bit enables the modem status interrupt.
- Bits 4 through 7: These bits are not used (always cleared).

### Interrupt Identification Register (IIR)

The ACE has an on-chip interrupt generation and prioritization capability that permits a flexible interface with the most popular microprocessors.

The ACE provides four prioritized levels of interrupts:

- Priority 1 - Receiver line status (highest priority)
- Priority 2 - Receiver data ready or receiver character time-out
- Priority 3 - Transmitter holding register empty
- Priority 4 - Modem status (lowest priority)

When an interrupt is generated, the IIR indicates that an interrupt is pending and encodes the type of interrupt in its three least significant bits (bits 0, 1, and 2). The contents of this register are summarized in Table 3 and described in Table 5. Details on each bit is as follows:

- Bit 0: This bit is used either in a hardwired prioritized or polled interrupt system. When bit 0 is cleared, an interrupt is pending. If bit 0 is set, no interrupt is pending.
- Bits 1 and 2: These two bits identify the highest priority interrupt pending as indicated in Table 3.
- Bit 3: This bit is always cleared in TL16C450 mode. In FIFO mode, bit 3 is set with bit 2 to indicate that a time-out interrupt is pending.
- Bits 4 and 5: These two bits are not used (always cleared).
- Bits 6 and 7: These bits are always cleared in TL16C450 mode. They are set when bit 0 of the FIFO control register is set.

**Table 5. Interrupt Control Functions**

| INTERRUPT IDENTIFICATION REGISTER |       |       |       | PRIORITY LEVEL | INTERRUPT TYPE                | INTERRUPT SOURCE  | INTERRUPT RESET METHOD            |
|-----------------------------------|-------|-------|-------|----------------|-------------------------------|---|-----------------------------------|
| BIT 3                             | BIT 2 | BIT 1 | BIT 0 |                |                               |   |                                   |
| 0                                 | 0     | 0     | 1     | None           | None                          | None  | None                              |
| 0                                 | 1     | 1     | 0     | 1              | Receiver line status          | Overrun error, parity error, framing error, or break interrupt  | Read the line status register     |
| 0                                 | 1     | 0     | 0     | 2              | Received data available       | Receiver data available in the TL16C450 mode or trigger level reached in the FIFO mode  | Read the receiver buffer register |
| 1                                 | 1     | 0     | 0     | 2              | Character time-out indication | No characters have been removed from or input to the receiver FIFO during the last four character times, and there is at least one character in it during this time | Read the receiver buffer register |

## TL16C2552

SLWS163A–SEPTEMBER 2005–REVISED JUNE 2006

**Table 5. Interrupt Control Functions (continued)**

| INTERRUPT IDENTIFICATION REGISTER |       |       |       | PRIORITY LEVEL | INTERRUPT TYPE                     | INTERRUPT SOURCE  | INTERRUPT RESET METHOD   |
|-----------------------------------|-------|-------|-------|----------------|------------------------------------|---|--|
| BIT 3                             | BIT 2 | BIT 1 | BIT 0 |                |                                    |   |  |
| 0                                 | 0     | 1     | 0     | 3              | Transmitter holding register empty | Transmitter holding register empty                                    | Read the interrupt identification register (if source of interrupt) or writing into the transmitter holding register |
| 0                                 | 0     | 0     | 0     | 4              | Modem status                       | Clear to send, data set ready, ring indicator, or data carrier detect | Read the modem status register   |

### Line Control Register (LCR)

The system programmer controls the format of the asynchronous data communication exchange through the LCR. In addition, the programmer is able to retrieve, inspect, and modify the contents of the LCR; this eliminates the need for separate storage of the line characteristics in system memory. The contents of this register are summarized in [Table 3](#) and described in the following bulleted list.

- Bits 0 and 1: These two bits specify the number of bits in each transmitted or received serial character. These bits are encoded as shown in [Table 6](#).

**Table 6. Serial Character Word Length**

| BIT 1 | BIT 0 | WORD LENGTH |
|-------|-------|-------------|
| 0     | 0     | 5 bits      |
| 0     | 1     | 6 bits      |
| 1     | 0     | 7 bits      |
| 1     | 1     | 8 bits      |

- Bit 2: This bit specifies either one, one and one-half, or two stop bits in each transmitted character. When bit 2 is cleared, one stop bit is generated in the data. When bit 2 is set, the number of stop bits generated is dependent on the word length selected with bits 0 and 1. The receiver clocks only the first stop bit regardless of the number of stop bits selected. The number of stop bits generated in relation to word length and bit 2 are shown in [Table 7](#).

**Table 7. Number of Stop Bits Generated**

| BIT 2 | Word Length Selected by Bits 1 and 2 | Number of Stop Bits Generated |
|-------|--------------------------------------|-------------------------------|
| 0     | Any word length                      | 1                             |
| 1     | 5 bits                               | 1 ½                           |
| 1     | 6 bits                               | 2                             |
| 1     | 7 bits                               | 2                             |
| 1     | 8 bits                               | 2                             |

- Bit 3: This bit is the parity enable bit. When bit 3 is set, a parity bit is generated in transmitted data between the last data word bit and the first stop bit. In received data, if bit 3 is set, parity is checked. When bit 3 is cleared, no parity is generated or checked.
- Bit 4: This bit is the even parity select bit. When parity is enabled (bit 3 is set) and bit 4 is set, even parity (an even number of logic 1s in the data and parity bits) is selected. When parity is enabled and bit 4 is cleared, odd parity (an odd number of logic 1s) is selected.
- Bit 5: This bit is the stick parity bit. When bits 3, 4, and 5 are set, the parity bit is transmitted and checked as cleared. When bits 3 and 5 are set and bit 4 is cleared, the parity bit is transmitted and checked as set. If bit 5 is cleared, stick parity is disabled.
- Bit 6: This bit is the break control bit. Bit 6 is set to force a break condition; i.e., a condition where TX is forced to the spacing (cleared) state. When bit 6 is cleared, the break condition is disabled and has no effect on the transmitter logic; it only effects TX.

- Bit 7: This bit is the divisor latch access bit (DLAB). Bit 7 must be set to access the divisor latches of the baud generator during a read or write. Bit 7 must be cleared during a read or write to access the receiver buffer, the THR, or the IER.

## Line Status Register (LSR)

### NOTE:

The line status register is intended for read operations only; writing to this register is not recommended outside of a factory testing environment.

The LSR provides information to the CPU concerning the status of data transfers. The contents of this register are summarized in [Table 3](#) and described in the following bulleted list.

- Bit 0: This bit is the data ready (DR) indicator for the receiver. DR is set whenever a complete incoming character has been received and transferred into the RBR or the FIFO. DR is cleared by reading all of the data in the RBR or the FIFO.

### NOTE:

Bits 1 through 4 are the error conditions that produce a receiver line status interrupt.

- Bit 1: This bit is the overrun error (OE) indicator. When OE is set, it indicates that before the character in the RBR was read, it was overwritten by the next character transferred into the register. OE is cleared every time the CPU reads the contents of the LSR. If the FIFO mode data continues to fill the FIFO beyond the trigger level, an overrun error occurs only after the FIFO is full, and the next character has been completely received in the shift register. An overrun error is indicated to the CPU as soon as it happens. The character in the shift register is overwritten, but it is not transferred to the FIFO.
- Bit 2: This bit is the parity error (PE) indicator. When PE is set, it indicates that the parity of the received data character does not match the parity selected in the LCR (bit 4). PE is cleared every time the CPU reads the contents of the LSR. In the FIFO mode, this error is associated with the particular character in the FIFO to which it applies. This error is revealed to the CPU when its associated character is at the top of the FIFO.
- Bit 3: This bit is the framing error (FE) indicator. When FE is set, it indicates that the received character did not have a valid (set) stop bit. FE is cleared every time the CPU reads the contents of the LSR. In the FIFO mode, this error is associated with the particular character in the FIFO to which it applies. This error is revealed to the CPU when its associated character is at the top of the FIFO. The ACE tries to resynchronize after a framing error. To accomplish this, it is assumed that the framing error is due to the next start bit. The ACE samples this start bit twice and then accepts the input data.
- Bit 4: This bit is the break interrupt (BI) indicator. When BI is set, it indicates that the received data input was held low for longer than a full-word transmission time. A full-word transmission time is defined as the total time to transmit the start, data, parity, and stop bits. BI is cleared every time the CPU reads the contents of the LSR. In the FIFO mode, this error is associated with the particular character in the FIFO to which it applies. This error is revealed to the CPU when its associated character is at the top of the FIFO. When a break occurs, only one 0 character is loaded into the FIFO. The next character transfer is enabled after RX goes to the marking state for at least two RCLK samples and then receives the next valid start bit.
- Bit 5: This bit is the THRE indicator. THRE is set when the THR is empty, indicating that the ACE is ready to accept a new character. If the THRE interrupt is enabled when THRE is set, an interrupt is generated. THRE is set when the contents of the THR are transferred to the TSR. THRE is cleared concurrent with the loading of the THR by the CPU. In the FIFO mode, THRE is set when the transmit FIFO is empty; it is cleared when at least one byte is written to the transmit FIFO.
- Bit 6: This bit is the transmitter empty (TEMT) indicator. TEMT bit is set when the THR and the TSR are both empty. When either the THR or the TSR contains a data character, TEMT is cleared. In the FIFO mode, TEMT is set when the transmitter FIFO and shift register are both empty.
- Bit 7: In the TL16C450 mode, this bit is always cleared. In the FIFO mode, LSR7 is set when there is at least one parity, framing, or break error in the FIFO. It is cleared when the microprocessor reads the LSR and there are no subsequent errors in the FIFO.

## TL16C2552

SLWS163A–SEPTEMBER 2005–REVISED JUNE 2006

### Modem Control Register (MCR)

The MCR is an 8-bit register that controls an interface with a modem, data set, or peripheral device that is emulating a modem. The contents of this register are summarized in [Table 3](#) and are described in the following bulleted list.

- Bit 0: This bit (DTR) controls the  $\overline{\text{DTR}}$  output.
- Bit 1: This bit (RTS) controls the  $\overline{\text{RTS}}$  output.
- Bit 2: This bit (OUT1) is reserved for output and can also be used for loopback mode.
- Bit 3: This bit (OUT2) controls the high-impedance state output buffer for the INT signal and the  $\overline{\text{OP}}$  output. When low, the INT signal is in a high-impedance state and  $\overline{\text{OP}}$  is high. When high, the INT signal is enabled and  $\overline{\text{OP}}$  is low.  $\overline{\text{OP}}$  is presented on MF when AFR (2:1) = 00.
- Bit 4: This bit (LOOP) provides a local loop back feature for diagnostic testing of the ACE. When LOOP is set, the following occurs:
  - The transmitter TX is set high.
  - The receiver RX is disconnected.
  - The output of the TSR is looped back into the receiver shift register input.
  - The four modem control inputs ( $\overline{\text{CTS}}$ ,  $\overline{\text{DSR}}$ ,  $\overline{\text{CD}}$ , and  $\overline{\text{RI}}$ ) are disconnected.
  - The four modem control outputs ( $\overline{\text{DTR}}$ ,  $\overline{\text{RTS}}$ ,  $\overline{\text{OUT1}}$ , and  $\overline{\text{OUT2}}$ ) are internally connected to the four modem control inputs.
  - The four modem control outputs are forced to the inactive (high) levels.
- Bit 5: This bit (AFE) is the autoflow control enable. When set, the autoflow control as described in the detailed description is enabled.

In the diagnostic mode, data that is transmitted is immediately received. This allows the processor to verify the transmit and receive data paths to the ACE. The receiver and transmitter interrupts are fully operational. The modem control interrupts are also operational, but the modem control interrupt's sources are now the lower four bits of the MCR instead of the four modem control inputs. All interrupts are still controlled by the IER.

The ACE flow can be configured by programming bits 1 and 5 of the MCR as shown in [Table 8](#).

**Table 8. ACE Flow Configuration**

| MCR BIT 5 (AFE) | MCR BIT 1 (RTS) | ACE FLOW CONFIGURATION   |
|-----------------|-----------------|--|
| 1               | 1               | Auto- $\overline{\text{RTS}}$ and auto- $\overline{\text{CTS}}$ enabled (autoflow control enabled) |
| 1               | 0               | Auto- $\overline{\text{CTS}}$ only enabled   |
| 0               | X               | Auto- $\overline{\text{RTS}}$ and auto- $\overline{\text{CTS}}$ disabled                           |

### Modem Status Register (MSR)

The MSR is an 8-bit register that provides information about the current state of the control lines from the modem, data set, or peripheral device to the CPU. Additionally, four bits of this register provide change information; when a control input from the modem changes state, the appropriate bit is set. All four bits are cleared when the CPU reads the MSR. The contents of this register are summarized in [Table 3](#) and are described in the following bulleted list.

- Bit 0: This bit is the change in clear-to-send ( $\Delta\text{CTS}$ ) indicator.  $\Delta\text{CTS}$  indicates that the  $\overline{\text{CTS}}$  input has changed state since the last time it was read by the CPU. When  $\Delta\text{CTS}$  is set (autoflow control is not enabled and the modem status interrupt is enabled), a modem status interrupt is generated. When autoflow control is enabled ( $\Delta\text{CTS}$  is cleared), no interrupt is generated.
- Bit 1: This bit is the change in data set ready ( $\Delta\text{DSR}$ ) indicator.  $\Delta\text{DSR}$  indicates that the  $\overline{\text{DSR}}$  input has changed state since the last time it was read by the CPU. When  $\Delta\text{DSR}$  is set and the modem status interrupt is enabled, a modem status interrupt is generated.
- Bit 2: This bit is the trailing edge of the ring indicator (TERI) detector. TERI indicates that the  $\overline{\text{RI}}$  input to the chip has changed from a low to a high level. When TERI is set and the modem status interrupt is enabled, a modem status interrupt is generated.
- Bit 3: This bit is the change in data carrier detect ( $\Delta\text{DCD}$ ) indicator.  $\Delta\text{DCD}$  indicates that the DCD input to the chip has changed state since the last time it was read by the CPU. When  $\Delta\text{DCD}$  is set and the modem status interrupt is enabled, a modem status interrupt is generated.

- Bit 4: This bit is the complement of the clear-to-send ( $\overline{\text{CTS}}$ ) input. When the ACE is in the diagnostic test mode (LOOP [MCR4] = 1), this bit is equal to the MCR bit 1 (RTS).
- Bit 5: This bit is the complement of the data set ready ( $\overline{\text{DSR}}$ ) input. When the ACE is in the diagnostic test mode (LOOP [MCR4] = 1), this bit is equal to the MCR bit 0 (DTR).
- Bit 6: This bit is the complement of the ring indicator ( $\overline{\text{RI}}$ ) input. When the ACE is in the diagnostic test mode (LOOP [MCR4] = 1), this bit is equal to the MCR bit 2 (OUT1).
- Bit 7: This bit is the complement of the data carrier detect ( $\overline{\text{DCD}}$ ) input. When the ACE is in the diagnostic test mode (LOOP [MCR4] = 1), this bit is equal to the MCR bit 3 (OUT2).

### Programmable Baud Generator

The ACE contains a programmable baud generator that takes a clock input in the range between dc and 16 MHz and divides it by a divisor in the range between 1 and (216 -1). The output frequency of the baud generator is sixteen times (16 y) the baud rate. The formula for the divisor is:

divisor = XIN frequency input P (desired baud rate y 16)

Two 8-bit registers, called divisor latches, store the divisor in a 16-bit binary format. These divisor latches must be loaded during initialization of the ACE in order to ensure desired operation of the baud generator. When either of the divisor latches is loaded, a 16-bit baud counter is also loaded to prevent long counts on initial load.

Table 9 and Table 10 illustrate the use of the baud generator with crystal frequencies of 1.8432 MHz and 3.072 MHz respectively. For baud rates of 38.4 kbits/s and below, the error obtained is small. The accuracy of the selected baud rate is dependent on the selected crystal frequency (see Figure 27 for examples of typical clock circuits).

**Table 9. Baud Rates Using a 1.8432-MHz Crystal**

| DESIRED BAUD RATE | DIVISOR USED TO GENERATE 16x CLOCK | PERCENT ERROR DIFFERENCE BETWEEN DESIRED AND ACTUAL |
|-------------------|------------------------------------|---|
| 50                | 2304                               |   |

### Receiver Buffer Register (RBR)

The ACE receiver section consists of a receiver shift register (RSR) and a RBR. The RBR is actually a 16-byte FIFO. Timing is derived from the input clock divided by the programmed divisor. Receiver section control is a function of the ACE line control register.

The ACE RSR receives serial data from RX. The RSR then concatenates the data and moves it into the RBR FIFO. In the TL16C450 mode, when a character is placed in the RBR and the received data available interrupt is enabled (IER0 = 1), an interrupt is generated. This interrupt is cleared when the data is read out of the RBR. In the FIFO mode, the interrupts are generated based on the control setup in the FIFO control register.

### Scratch Register

The scratch register is an 8-bit register that is intended for the programmer's use as a scratchpad in the sense that it temporarily holds the programmer's data without affecting any other ACE operation.

## Transmitter Holding Register (THR)

The ACE transmitter section consists of a THR and a transmitter shift register (TSR). The THR is actually a 16-byte FIFO. Timing is derived from the input clock divided by the programmed divisor. Transmitter section control is a function of the ACE line control register.

The ACE THR receives data off the internal data bus and when the shift register is idle, moves it into the TSR. The TSR serializes the data and outputs it at TX. In the TL16C450 mode, if the THR is empty and the transmitter holding register empty (THRE) interrupt is enabled (IER1 = 1), an interrupt is generated. This interrupt is cleared when a character is loaded into the register. In the FIFO mode, the interrupts are generated based on the control setup in the FIFO control register.

## Alternate Function Register (AFR) - Read/Write

This register is used to select specific modes of  $\overline{MF}$  operation and to allow both UART register sets to be written concurrently.

### AFR[0]: Concurrent Write Mode

When this bit is set, the CPU can write concurrently to the same register in both UARTs. This function is intended to reduce the dual UART initialization time. It can be used by the CPU when both channels are initialized to the same state. The external CPU can set or clear this bit by accessing either register set. When this bit is set, the channel select pin still selects the channel to be accessed during read operations. The user should ensure that LCR bit 7 of both channels are in the same state before executing a concurrent write to the registers at addresses 0, 1, or 2.

- Logic 0 = No concurrent write (default)
- Logic 1 = Register set A and B are written concurrently with a single external CPU I/O write operation.

### AFR[2:1]: $\overline{MF}$ Output Select

These bits select a signal function for output on the  $\overline{MF}$  A/B pins. These signal functions are described as:  $\overline{OP}$ , BAUDOUT, or RXRDY. Only one signal function can be selected at a time.

**$\overline{MF}$  Function**

| Bit 2 | Bit 1 | $\overline{MF}$ Function  |
|-------|-------|---------------------------|
| 0     | 0     | $\overline{OP}$ (default) |
| 0     | 1     | BAUDOUT                   |
| 1     | 0     | RXRDY                     |
| 1     | 1     | Reserved                  |

### AFR[7:3]: Reserved

All are initialized to logic 0.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

### Products

|                              |  |
|------------------------------|--|
| Audio                        | <a href="http://www.ti.com/audio">www.ti.com/audio</a>                               |
| Amplifiers                   | <a href="http://amplifier.ti.com">amplifier.ti.com</a>                               |
| Data Converters              | <a href="http://dataconverter.ti.com">dataconverter.ti.com</a>                       |
| DLP® Products                | <a href="http://www.dlp.com">www.dlp.com</a>   |
| DSP                          | <a href="http://dsp.ti.com">dsp.ti.com</a>   |
| Clocks and Timers            | <a href="http://www.ti.com/clocks">www.ti.com/clocks</a>                             |
| Interface                    | <a href="http://interface.ti.com">interface.ti.com</a>                               |
| Logic                        | <a href="http://logic.ti.com">logic.ti.com</a>                                       |
