## PROFET® Data sheet BTS 6144B/P

### Smart Highside Power Switch

#### Reversave™

- Reverse battery protection by self turn on of power MOSFET

#### Features

- Short circuit protection with latch
- Current limitation
- Overload protection
- Thermal shutdown with restart
- Overtoltage protection (including load dump)
- Loss of ground protection
- Loss of  $V_{bb}$  protection (with external diode for charged inductive loads)
- Very low standby current
- Fast demagnetization of inductive loads
- Electrostatic discharge (ESD) protection
- Optimized static electromagnetic compatibility (EMC)

#### Diagnostic Function

- Proportional load current sense (with defined fault signal in case of overload operation, overtemperature shutdown and/or short circuit shutdown)

#### Application

- Power switch with current sense diagnostic feedback for 12V and 24 V DC grounded loads
- All types of resistive, inductive and capacitive loads
- Replaces electromechanical relays, fuses and discrete circuits

#### General Description

N channel vertical power FET with charge pump, current controlled input and diagnostic feedback with load current sense, integrated in Smart SIPMOS® chip on chip technology. Providing embedded protective functions.

#### Product Summary

Operating voltage	$V_{bb(on)}$	5.5 ... 38	V
On-state resistance	$R_{ON}$	9	$m\Omega$
Nominal current	$I_L(nom)$	9.5	A
Load current (ISO)	$I_L(ISO)$	37.5	A
Current limitation	$I_{L12(SC)}$	90	A

#### Package

TO 220-7-180

TO 220-7-230

## Data sheet BTS 6144B/P

Pin	Symbol	Function
1; 2	OUT O	<b>Output</b> ; output to the load; pin 1, 2, 6 and 7 must be externally shorted* .
3	IN I	<b>Input</b> ; activates the power switch if shorted to ground.
4; Tab	V <sub>bb</sub> +	<b>Supply Voltage</b> ; positive power supply voltage; tab and pin4 are internally shorted.
5	IS S	<b>Sense Output</b> ; Diagnostic feedback; provides at normal operation a sense current proportional to the load current; in case of overload, overtemperature and/or short circuit a defined current is provided (see Truth Table on page 8)
6; 7	OUT O	<b>Output</b> ; output to the load; pin 1, 2, 6 and 7 must be externally shorted* .

\*) Not shorting all outputs will considerably increase the on-state resistance, reduce the peak current capability and decrease the current sense accuracy

### Maximum Ratings at $T_j = 25^\circ\text{C}$ unless otherwise specified

Parameter	Symbol	Values	Unit
Supply voltage (overvoltage protection see page 4)	$V_{bb}$	38	V
Supply voltage for full short circuit protection <sup>1)</sup>	$V_{bb}$	30	V
Load dump protection $V_{\text{Load Dump}} = U_A + V_s$ , $U_A = 13.5 \text{ V}$ $R_I = 2 \Omega$ , $R_L = 1 \Omega$ , $t_d = 400 \text{ ms}$ , IN= low or high	$V_{\text{Load dump}}$ <sup>2)</sup>	45	V
Load current (Short-circuit current, see page 5)	$I_L$	self-limited	A
Operating temperature range	$T_j$	-40 ...+150	°C
Storage temperature range	$T_{stg}$	-55 ...+150	
Power dissipation (DC)	$P_{\text{tot}}$	81	W
Inductive load switch-off energy dissipation m <sup>3)</sup> single pulse, $I_L = 20 \text{ A}$ , $V_{bb} = 12 \text{ V}$ $T_j = 150^\circ\text{C}$ :	$E_{AS}$	0.4	J
Electrostatic discharge capability (ESD) (Human Body Model) acc. ESD assn. std. S5.1-1993; $R=1.5\text{k}\Omega$ ; $C=100\text{pF}$	$V_{ESD}$	3.0	kV
Current through input pin (DC)	$I_{IN}$	+15, -120	mA
Current through current sense pin (DC)	$I_{IS}$	+15, -120	
see internal circuit diagrams page 9			
Input voltage slew rate	$V_{bb} \leq 16\text{V} : \frac{dV_{bIN}}{dt}$ $V_{bb} > 16\text{V}^4) :$	self-limited 20	$\text{V}/\mu\text{s}$

1) Short circuit is defined as a combination of remaining resistances and inductances. See schematic on page 11.

2)  $V_{\text{Load dump}}$  is setup without the DUT connected to the generator per ISO 7637-1 and DIN 40839

3) See also diagram on page 11.

4) See also on page 8. Slew rate limitation can be achieved by means of using a series resistor  $R_{IN}$  in the input path. This resistor is also required for reverse operation. See also page 10.

L = "Low" Level  
 H = "High" Level

Z = high impedance, potential depends on external circuit

### Terms

Two or more devices can easily be connected in parallel to increase load current capability.

<sup>19)</sup> Overload is detected at the following condition:  $1V$  (typ.)  $< V_{ON} < 3.5V$  (typ.) . See also page 11.

<sup>20)</sup> Short Circuit is detected at the following condition:  $V_{ON} > 3.5V$  (typ.) . See also page 11.

<sup>21)</sup> Low ohmic short to  $V_{bb}$  may reduce the output current  $I_L$  and therefore also the sense current  $I_{IS}$ .

## Data sheet BTS 6144B/P

### Input circuit (ESD protection)

ESD-Zener diode: 67 V typ., max 15 mA;

### Current sense output

Normal operation

$V_{Z,IS} = 67 \text{ V}$  (typ.),  $R_{IS} = 1 \text{ k}\Omega$  nominal (or  $1 \text{ k}\Omega /n$ , if  $n$  devices are connected in parallel).  $I_S = I_L/k_{lis}$  can be only driven by the internal circuit as long as

$V_{out} - V_{IS} > 5\text{V}$ . Therefore  $R_{IS}$  should be less than

$$\frac{V_{bb} - 5V}{7.5mA}.$$

Note: For large values of  $R_{IS}$  the voltage  $V_{IS}$  can reach almost  $V_{bb}$ . See also overvoltage protection.

If you don't use the current sense output in your application, you can leave it open.

### Inductive and overvoltage output clamp

$V_{ON}$  is clamped to  $V_{ON(Cl)} = 42\text{V}$  typ

### Overvoltage protection of logic part

$R_{bb} = 100\Omega$  typ.,  $V_{Z,IN} = V_{Z,IS} = 67\text{V}$  typ.,  $R_{IS} = 1\text{k}\Omega$  nominal. Note that when overvoltage exceeds 67V typ. a voltage above 5V can occur between IS and GND, if  $R_V$ ,  $V_{Z,VIS}$  are not used.

## Data sheet BTS 6144B/P

### Reversave™ (Reverse battery protection)

$R_{IS}$  typ. 1 kΩ. Add  $R_{IN}$  for reverse battery protection in applications with  $V_{bb}$  above 16V;

$$\text{recommended value: } \frac{1}{R_{IN}} + \frac{1}{R_{IS}} = \frac{0.08A}{|V_{bb}| - 12V}$$

To minimise power dissipation at reverse battery operation, the overall current into the IN and IS pin should be about 80mA. The current can be provided by using a small signal diode D in parallel to the input switch, by using a MOSFET input switch or by proper adjusting the current through  $R_{IS}$ .

Since the current via  $R_{bb}$  generates additional heat in the device, this has to be taken into account in the overall thermal consideration.

### Inverse load current operation

The device can be operated in inverse load current mode ( $V_{OUT} > V_{bb} > 0V$ ). The current sense feature is not available during this kind of operation ( $I_{IS} = 0$ ). In case of inverse operation the intrinsic drain source diode is eventually conducting resulting in considerably increased power dissipation.

The transition from inverse to forward mode can result in a delayed switch on.

Note: Temperature protection during inverse load current operation is not possible!

### $V_{bb}$ disconnect with energised inductive load

Provide a current path with load current capability by using a diode, a Z-diode, or a varistor. ( $V_{ZL} + V_D < 39V$  if  $R_{IN} = 0$ ). For higher clamp voltages currents at IN and IS have to be limited to 120 mA.

Version a:

## Data sheet BTS 6144B/P

### Short circuit detection

Fault Condition:  $V_{ON} > V_{ON(SC)}$  (3.5 V typ.) and  $t > t_{d(SC)}$  (typ.650  $\mu$ s).

### Overload detection

Fault Condition:  $V_{ON} > 1$  V typ.

### Short circuit

Short circuit is a combination of primary and secondary impedance's and a resistance's.

Allowable combinations of minimum, secondary resistance for full protection at given secondary inductance and supply voltage for single short circuit event:

### Inductive load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for  $R_L > 0 \Omega$ :

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left( 1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

### Maximum allowable load inductance for a single switch off

$L = f(I_L)$ ;  $T_{j,start} = 150^\circ\text{C}$ ,  $V_{bb} = 12$  V,  $R_L = 0 \Omega$

## Data sheet BTS 6144B/P

### Timing diagrams

**Figure 1a:** Switching a resistive load, change of load current in on-condition:

The sense signal is not valid during a settling time after turn-on/off and after change of load current.

**Figure 2a:** Switching motors and lamps:

As long as  $V_{bIS} < V_{Z,IS}$  the sense current will never exceed  $I_{IS,fault}$  and/or  $I_{IS,lim}$ .

**Figure 2b:** Switching an inductive load:

## Data sheet BTS 6144B/P

**Figure 3a:** Typ. current limitation characteristic

In case of  $V_{ON} > V_{ON(SC)}$  (typ. 3.5 V) the device will be switched off by internal short circuit detection.

**Figure 3b:** Short circuit type one:  
shut down by short circuit detection, reset by  $I_{IN} = 0$ .

Shut down remains latched until next reset via input.

**Figure 3c:** Short circuit type two:  
shut down by short circuit detection, reset by  $I_{IN} = 0$ .

Shut down remains latched until next reset via input.

### **Attention please!**

The information herein is given to describe certain components and shall not be considered as a guarantee of characteristics.

Terms of delivery and rights to technical change reserved.

We hereby disclaim any and all warranties, including but not limited to warranties of non-infringement, regarding circuits, descriptions and charts stated herein.

Infineon Technologies is an approved CECC manufacturer.

### **Information**

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office in Germany or our Infineon Technologies Representatives worldwide (see address list).

### **Warnings**

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
