## 5 V ECL Low Voltage 2:8 Differential Fanout Buffer

### Description

The MC100E310 is a low voltage, low skew 2:8 differential ECL fanout buffer designed with clock distribution in mind. The device features fully differential clock paths to minimize both device and system skew. The E310 offers two selectable clock inputs to allow for redundant or test clocks to be incorporated into the system clock trees.

The lowest TPD delay time results from terminating only one output pair, and the greatest TPD delay time results from terminating all the output pairs. This shift is about 10–20 pS in TPD. The skew between any two output pairs within a device is typically about 25 nS. If other output pairs are not terminated, the lowest TPD delay time results from both output pairs and the skew is typically 25 nS. When all outputs are terminated, the greatest TPD (delay time) occurs and all outputs display about the same 10–20 ps increase in TPD, so the relative skew between any two output pairs remains about 25 ns.

For more information on using PECL, designers should refer to ON Semiconductor Application Note [AN1406/D](#).

The  $V_{BB}$  pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to  $V_{BB}$  as a switching reference voltage.  $V_{BB}$  may also rebias AC coupled inputs. When used, decouple  $V_{BB}$  and  $V_{CC}$  via a 0.01  $\mu$ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used,  $V_{BB}$  should be left open.

The 100 Series Contains Temperature Compensation.

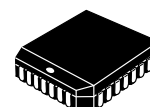

### Features

- Dual Differential Fanout Buffers
- 200 ps Part-to-Part Skew
- 50 ps Output-to-Output Skew
- 28-lead PLCC Packaging
- Q Output will Default LOW with Inputs Open or at  $V_{EE}$
- PECL Mode Operating Range:  $V_{CC} = 4.2$  V to 5.7 V with  $V_{EE} = 0$  V
- NECL Mode Operating Range:  $V_{CC} = 0$  V with  $V_{EE} = -4.2$  V to  $-5.7$  V
- Internal Input 50 k $\Omega$  Pulldown Resistors
- ESD Protection:
  - ♦ > 2 kV Human Body Model
  - ♦ > 200 V Machine Model
- Meets or Exceeds JEDEC Spec EIA/JESD78 IC Latchup Test
- Moisture Sensitivity: Level 3 (Pb-Free)  
(For Additional Information, see Application Note [AND8003/D](#))
- Flammability Rating: UL 94 V-0 @ 0.125 in, Oxygen Index: 28 to 34
- Transistor Count = 212 Devices
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant

- $V_{EE}$  can vary  $-0.46\text{ V}$  /  $+0.8\text{ V}$ .
- The differential propagation delay is defined as the delay from the crossing points of the differential input signals to the crossing point of the differential output signals. See *Definitions and Testing of ECLinPS AC Parameters* in Chapter 1 (page 1–12) of the ON Semiconductor High Performance ECL Data Book (DL140/D).
- The single-ended propagation delay is defined as the delay from the 50% point of the input signal to the 50% point of the output signal.
- The within-device skew is defined as the worst case difference between any two similar delay paths within a single device.
