LP5521 Programmable Three-Channel LED Driver

1 Features

- Adaptive Charge Pump With 1x and 1.5x Gain Provides Up to 95% LED Drive Efficiency
- Charge Pump with Soft Start and Overcurrent, Short-Circuit Protection
- Low Input Ripple and EMI
- Very Small Solution Size, No Inductor or Resistors Required
- 200-nA Typical Shutdown Current
- Automatic Power Save Mode
- I²C-Compatible Interface
- Independently Programmable Constant Current Outputs with 8-Bit Current Setting and 8-Bit PWM Control
- Typical LED Output Saturation Voltage 50 mV and Current Matching 1%
- Three Program Execution Engines with Flexible Instruction Set
- Autonomous Operation Without External Control
- Large SRAM Program Memory
- Two General Purpose Digital Outputs

2 Applications

- Fun and Indicator Lights
- LCD Sub-Display Backlighting
- Keypad RGB Backlighting and Phone Cosmetics
- Vibra, Speakers, Waveform Generator
- Blood Glucose Meter
- Handheld POS Terminals
- Electronic Access Control
- Where RGB Indication is Needed

3 Description

The LP5521 is a three-channel LED driver designed to produce variety of lighting effects for mobile devices. A high-efficiency charge pump enables LED driving over full Li-Ion battery voltage range. The device has a program memory for creating variety of lighting sequences. When program memory has been loaded, LP5521 can operate autonomously without processor control allowing power savings.

The device maintains excellent efficiency over a wide operating range by automatically selecting proper charge pump gain based on LED forward voltage requirements and is able to automatically enter power-save mode, when LED outputs are not active and thus lowering current consumption.

Three independent LED channels have accurate programmable current sources and PWM control. Each channel has program memory for creating desired lighting sequences with PWM control.

The LP5521 has a flexible digital interface. Trigger I/O and a 32-kHz clock input allow synchronization between multiple devices. Interrupt output can be used to notify processor, when LED sequence has ended. The LP5521 has four pin selectable I²C-compatible addresses. This allows connecting up to four parallel devices in one I²C-compatible bus. GPO and INT pins can be used as a digital control pin for other devices.

The LP5521 requires only four small, low-cost ceramic capacitors.

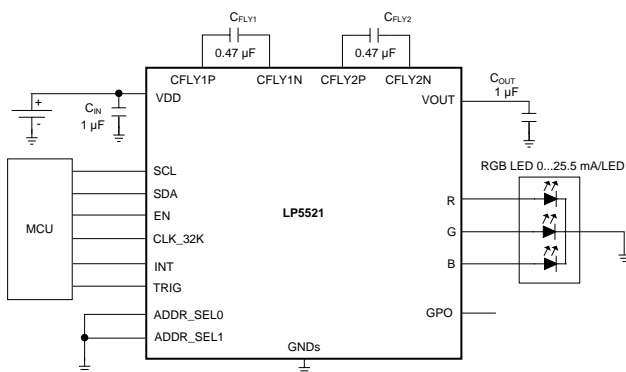

Comprehensive application tools are available, including command compiler for easy LED sequence programming.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE
LP5521TM	DSBGA (20)	2.093 mm × 1.733 mm (MAX)
LP5521YQ	WQFN (24)	5.00 mm × 4.00 mm (NOM)

4 Revision History

Changes from Revision G (September 2014) to Revision H	Page
• Added several new <i>Applications</i>	1
• Changed Body Size of DSBGA package to MAX dimensions	1
• Changed <i>Handling Ratings</i> to <i>ESD Ratings</i> table	5
• Changed R _{θJA} value for DSBGA from 50 – 90°C/W to 70.7°C/W and WQFN from 37 – 90°C/W to 38.4°C/W; add additional thermal information	6
• Added <i>Community Resources</i>	41

Changes from Revision F (February 2013) to Revision G	Page
• Added <i>Pin Configuration and Functions</i> section, <i>Handling Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section	1

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾⁽²⁾⁽³⁾

	MIN	MAX	UNIT
V (V _{DD} , V _{OUT} , R, G, B)	-0.3	6	V
Voltage on logic pins	-0.3	V _{DD} + 0.3 with 6 V maximum	V
Continuous power dissipation ⁽⁴⁾	Internally Limited		
Junction temperature, T _{J-MAX}	125		°C
Maximum lead temperature (soldering)	See ⁽⁵⁾		
Storage temperature, T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the potential at the GND pins.
- (3) If Military/Aerospace specified devices are required, contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (4) Internal thermal shutdown circuitry protects the device from permanent damage. Thermal shutdown engages at T_J = 150°C (typical) and disengages at T_J = 130°C (typical).
- (5) For detailed soldering specifications and information, please refer to *DSBGA Wafer Level Chip Scale Package (SNVA009)* or *Leadless Leadframe Package (LLP) (SNOA401)*.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾⁽²⁾

	MIN	MAX	UNIT
V _{DD}	2.7	5.5	V
Recommended charge pump load current I _{OUT}	0	100	mA
Junction temperature, T _J	-30	125	°C
Ambient temperature, T _A ⁽³⁾	-30	85	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the potential at the GND pins.
- (3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T_{A-MAX}) is dependent on the maximum operating junction temperature (T_{J-MAX-OP} = 125°C), the maximum power dissipation of the device in the application (P_{D-MAX}), and the junction-to ambient thermal resistance of the part/package in the application (R_{θJA}), as given by the following equation: T_{A-MAX} = T_{J-MAX-OP} - (R_{θJA} × P_{D-MAX}).

6.5 Electrical Characteristics

Unless otherwise noted, specifications apply to the LP5521 *Functional Block Diagram* with: $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $C_{OUT} = C_{IN} = 1\text{ }\mu\text{F}$, $C_{FLY1} = C_{FLY2} = 0.47\text{ }\mu\text{F}$; limits are for $T_J = 25^\circ\text{C}$ unless specified in the test conditions.⁽¹⁾⁽²⁾⁽³⁾

SYMBOL	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
I _{VDD}	Standby supply current	EN = 0 (pin), CHIP_EN = 0 (bit), external 32 kHz clock running or not running		0.2		μA	
		EN = 0 (pin), CHIP_EN = 0 (bit), external 32-kHz clock running or not running, $-30^\circ\text{C} < T_A < 85^\circ\text{C}$			2		
		EN = 1 (pin), CHIP_EN = 0 (bit), external 32-kHz clock not running		1		μA	
		EN = 1 (pin), CHIP_EN = 0 (bit), external 32-kHz clock running		1.4		μA	
	Normal mode supply current	Charge pump and LED drivers disabled			0.25		mA
		Charge pump in 1x mode, no load, LED drivers disabled			0.7		mA
		Charge pump in 1.5x mode, no load, LED drivers disabled			1.5		mA
		Charge pump in 1x mode, no load, LED drivers enabled			1.2		mA
	Powersave mode supply current	External 32-kHz clock running			10		μA
		Internal oscillator running			0.25		mA
f _{osc}	Internal oscillator frequency accuracy		-4%		4%		
		$-30^\circ\text{C} < T_A < 85^\circ\text{C}$	-7%		7%		

- (1) All voltages are with respect to the potential at the GND pins.
- (2) Minimum and Maximum limits are specified by design, test, or statistical analysis.
- (3) Low-ESR Surface-Mount Ceramic Capacitors (MLCCs) used in setting electrical characteristics.

6.6 Charge Pump Electrical Characteristics

Limits are for $T_J = 25^\circ\text{C}$ unless specified in the test conditions.⁽¹⁾

SYMBOL	PARAMETER	TEST CONDITION	MIN	TYP	MAX	UNIT
R _{OUT}	Charge pump output resistance	Gain = 1.5x		3.5		Ω
		Gain = 1x		1		Ω
f _{SW}	Switching frequency			1.25		MHz
		-30°C < T _A < 85°C	-7%		7%	
I _{GND}	Ground current	Gain = 1.5x		1.2		mA
		Gain = 1x		0.5		mA
t _{ON}	V _{OUT} turn-on time from charge pump off to 1.5x mode	V _{DD} = 3.6 V, CHIP_EN = H I _{OUT} = 60 mA		100		μs
V _{OUT}	Charge pump output voltage	V _{DD} = 3.6 V, no load, Gain = 1.5x		4.55		V

(1) Input, output, and fly capacitors should be of the type X5R or X7R low ESR ceramic capacitor.

6.7 LED Driver Electrical Characteristics (R, G, B Outputs)

Limits are for $T_J = 25^\circ\text{C}$ unless specified in the test conditions.

SYMBOL	PARAMETER	TEST CONDITION	MIN	TYP	MAX	UNIT
I _{LEAKAGE}	R, G, B pin leakage current			0.1		μA
		-30°C < T _A < 85°C			1	
I _{MAX}	Maximum source current	Outputs R, G, B		25.5		mA
I _{OUT}	Accuracy of output current	Output current set to 17.5 mA, V _{DD} = 3.6 V	-4%		4%	
		Output current set to 17.5 mA, V _{DD} = 3.6 V, -30°C < T _A < 85°C	-5%		5%	
I _{MATCH}	Matching ⁽¹⁾	I _{OUT} = 17.5 mA, V _{DD} = 3.6 V		1%	2%	
f _{LED}	LED PWM switching frequency	PWM_HF = 1 Frequency defined by internal oscillator		558		Hz
		PWM_HF = 0 Frequency defined by 32-kHz clock (internal or external)		256		Hz
V _{SAT}	Saturation voltage ⁽²⁾	I _{OUT} set to 17.5 mA		50	100	mV

(1) Matching is the maximum difference from the average of the three output's currents.

(2) Saturation voltage is defined as the voltage when the LED current has dropped 10% from the value measured at V_{OUT} - 1 V.

6.8 Logic Interface Characteristics

(V(EN) = 1.65 V...V_{DD}, and limits apply through ambient temperature range -30°C < T_A < +85°C, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
LOGIC INPUT EN					
V _{IL}	Input low level			0.5	V
V _{IH}	Input high level	1.2			V
I _I	Logic input current	-1		1	μA
t _{DELAY}	Input delay ⁽¹⁾	T _J = 25°C	2		μs

(1) The I²C-compatible host should allow at least 1 ms before sending data to the LP5521 after the rising edge of the enable line.

7 Detailed Description

7.1 Overview

The LP5521 is a three-channel LED driver designed to produce variety of lighting effects for mobile devices. A high-efficiency charge pump enables LED driving over full Li-Ion battery voltage range. The device has a program memory for creating variety of lighting sequences. When program memory has been loaded, the LP5521 can operate autonomously without processor control allowing power savings.

The device maintains excellent efficiency over a wide operating range by automatically selecting proper charge pump gain based on LED forward voltage requirements. the LP5521 is able to automatically enter power-save mode, when LED outputs are not active and thus lowering current consumption.

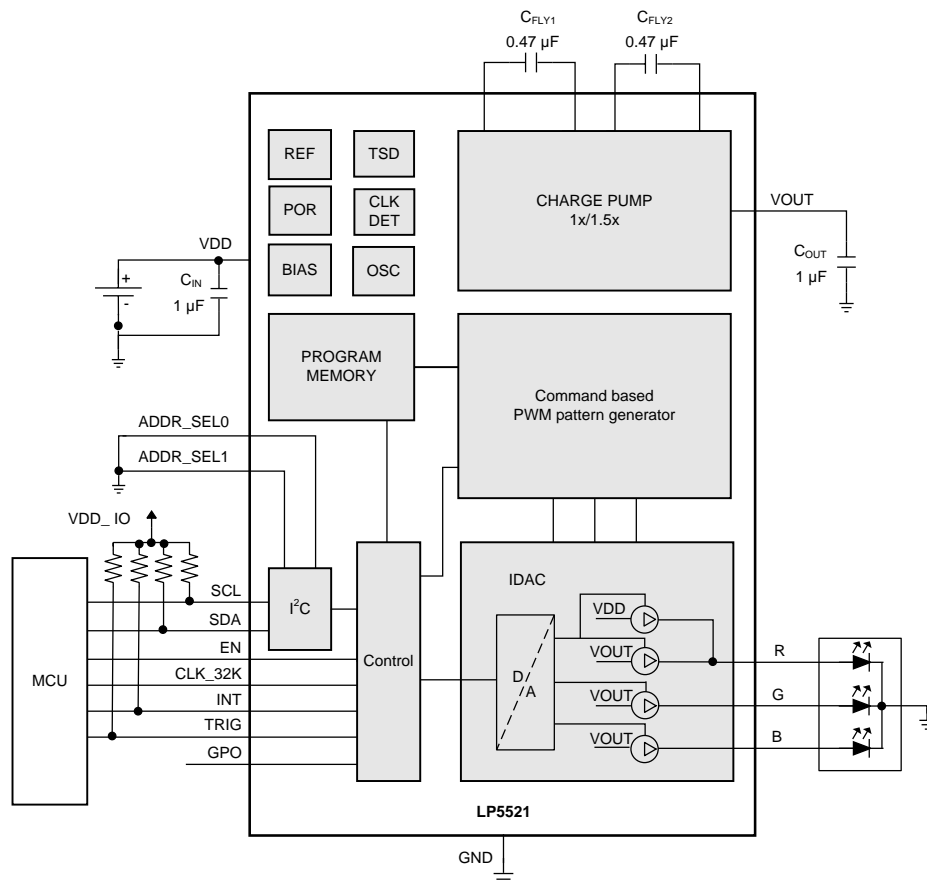

Three independent LED channels have accurate programmable current sources and PWM control. Each channel has program memory for creating desired lighting sequences with PWM control.

The LP5521 has a flexible digital interface. A trigger I/O and 32-kHz clock input allow synchronization between multiple devices. Interrupt output can be used to notify processor, when LED sequence has ended. LP5521 has four pin-selectable I²C-compatible addresses. This allows connecting up to four parallel devices in one I²C-compatible bus. GPO and INT pins can be used as a digital control pin for other devices.

The LP5521 requires only four small and low-cost ceramic capacitors.

Comprehensive application tools are available, including command compiler for easy LED sequence programming.

7.3 Feature Description

7.3.1 Charge Pump Operational Description

The LP5521 includes a pre-regulated switched-capacitor charge pump with a programmable voltage multiplication of 1 and 1.5x.

In 1.5x mode by combining the principles of a switched-capacitor charge pump and a linear regulator, the device generates a regulated 4.5-V output from Li-Ion input voltage range. A two-phase non-overlapping clock generated internally controls the operation of the charge pump. During the charge phase, both flying capacitors (C_{FLY1} and C_{FLY2}) are charged from input voltage. In the pump phase that follows, the flying capacitors are discharged to output. A traditional switched capacitor charge pump operating in this manner uses switches with very low on-resistance, ideally 0 Ω , to generate an output voltage that is 1.5x the input voltage. The LP5521 regulates the output voltage by controlling the resistance of the input-connected pass-transistor switches in the charge pump.

7.3.1.1 Output Resistance

At lower input voltages, the charge pump output voltage may degrade due to effective output resistance (R_{OUT}) of the charge pump. The expected voltage drop can be calculated by using a simple model for the charge pump shown in [Figure 14](#).

Copyright © 2016, Texas Instruments Incorporated

Figure 14. Charge Pump Block Diagram

The model shows a linear pre-regulation block (REG), a voltage multiplier (1.5x), and an output resistance (R_{OUT}). Output resistance models the output voltage drop that is inherent to switched capacitor converters. The output resistance is 3.5 Ω (typical) and is function of switching frequency, input voltage, capacitance value of the flying capacitors, internal resistances of switches, and ESR of flying capacitors. When the output voltage is in regulation, the regulator in the model controls the voltage V' to keep the output voltage equal to 4.5 V (typical). With increased output current, the voltage drop across R_{OUT} increases. To prevent drop in output voltage, the voltage drop across the regulator is reduced, V' increases, and V_{OUT} remains at 4.5 V. When the output current increases to the point that there is zero voltage drop across the regulator, V' equals the input voltage, and the output voltage is on the edge of regulation. Additional output current causes the output voltage to fall out of regulation, so that the operation is similar to a basic open-loop 1.5x charge pump. In this mode, output current results in output voltage drop proportional to the output resistance of the charge pump. The out-of-regulation output voltage can be approximated by: $V_{OUT} = 1.5 \times V_{IN} - I_{OUT} \times R_{OUT}$.

7.3.1.2 Controlling Charge Pump

The charge pump is controlled with two CP_MODE bits in register 08H. When both bits are low, the charge pump is disabled, and the output voltage is pulled down with 300 k Ω . Charge pump can be forced to bypass mode, so that battery voltage is going directly to RGB outputs. In 1.5x mode output voltage is boosted to 4.5 V. In automatic mode, charge pump operation mode is defined by LED outputs saturation described in [LED Forward Voltage Monitoring](#). [Table 1](#) lists operation modes and selection bits.

Table 1. CONFIG Register (08H)

NAME	BIT	DESCRIPTION
CP_MODE	4:3	Charge pump operation mode 00b = OFF 01b = Forced to bypass mode (1x) 10b = Forced to 1.5x mode 11b = Automatic mode selection

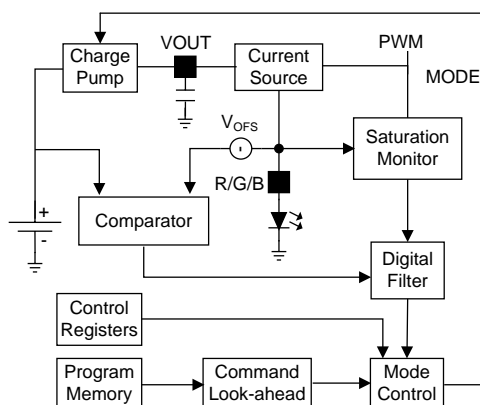

7.3.1.3 LED Forward Voltage Monitoring

When charge pump automatic mode selection is enabled, voltages over LED drivers are monitored. If drivers do not have enough headroom, charge pump gain is set to 1.5x. Driver saturation monitor does not have a fixed voltage limit, since saturation voltage is a function of temperature and current. Charge pump gain is set to 1x, when battery voltage is high enough to supply all LEDs.

In automatic gain change mode, charge pump is switched to bypass mode (1x), when LEDs are inactive for over 50 ms.

Charge pump gain control utilizes digital filtering to prevent supply voltage disturbances from triggering gain changes. If the R driver current source is connected to a battery (address 08H, bit R_TO_BATT = 1), voltage monitoring is disabled in R output, but still functional in B and G outputs.

LED forward voltage monitoring and gain control block diagram is shown in Figure 15.

Copyright © 2016, Texas Instruments Incorporated

Figure 15. Voltage Monitoring Block Diagram for One Output

7.3.2 LED Driver Operational Description

The LP5521 LED drivers are constant current sources with 8-bit PWM control. Output current can be programmed with I²C register up to 25.5 mA. Current setting resolution is 100 μA (8-bit control).

R driver has two modes: current source can be connected to the battery (V_{DD}) or to the charge pump output. If a current source is connected to the battery, automatic charge pump gain control is not used for this output. This approach provides better efficiency when LED with low V_F is connected to R driver, and battery voltage is high enough to drive this LED in all conditions. R driver mode can be selected with I²C register bit. When address 08H, bit R_TO_BATT = 1, R current source is connected to battery. When it is 0 (default), R current source is connected to charge pump same way as in G and B drivers. G and B drivers are always connected to charge pump output.

Some LED configuration examples are given in Table 2. When LEDs with low V_F are used, charge pump can be operating in bypass mode (1x). This eliminates the need of having double drivers for all outputs; one connected to battery and another connected to charge pump output. When LP5521 is driving a RGB LED, R channel can be configured to use battery power. This configuration increases power efficiency by minimizing the voltage drop across the LED driver.

Table 2. LED Configuration Examples

CONFIGURATION	R OUTPUT TO BATT	R OUTPUT TO CP	CP MODE
RGB LED with low V _F red	X		Auto (1x or 1.5x)
3 x low V _F LED		X	1x
3 x white LED		X	Auto (1x or 1.5x)
1 x low V _F LED (R output)	X		Disabled

LP5521

SNVS441H – JANUARY 2007 – REVISED MAY 2016

www.ti.com

PWM frequency is either 256 Hz or 558 Hz, frequency is set with PWM_HF bit in register 08H. When PWM_HF is 0, the frequency is 256 Hz, and when bit is 1, the PWM frequency is 558 Hz. Brightness adjustment is either linear or logarithmic. This can be set with register 00H LOG_EN bit. When LOG_EN = 0 linear adjustment scale is used, and when LOG_EN = 1 logarithmic scale is used. By using logarithmic scale the visual effect seems linear to the eye. Register control bits are presented in Table 3, Table 4, and Table 5:

Table 3. R_CURRENT Register (05H), G_CURRENT register (06H), B_CURRENT register (07H):

Figure 16. Logarithmic and Linear PWM Adjustment Curves

7.3.3 Automatic Power Save

Automatic power save mode is enabled when PWRSAVE_EN bit in register address 08H is 1. Almost all analog blocks are powered down in power save, if external clock is used. Only charge pump protection circuits remain active. However if internal clock has been selected only charge pump and led drivers are disabled during power save since digital part of the LED controller need to remain active. In both cases charge pump enters 'weak 1x' mode. In this mode charge pump utilizes a passive current limited keep-alive switch, which keeps the output voltage at battery level.

During program execution LP5521 can enter power save if there is no PWM activity in R, G and B outputs. To prevent short power save sequences during program execution, LP5521 has command look-ahead filter. In every instruction cycle R, G, B commands are analyzed, and if there is sufficient time left with no PWM activity, the device enters power save. In power save program execution continues uninterrupted. When a command that requires PWM activity is executed, fast internal start-up sequence will be started automatically. Table 6 describe commands and conditions that can activate power save. All channels (R,G,B) need to meet power save condition in order to enable power save.

Table 6. LED Controller Operation

LED CONTROLLER OPERATION MODE (R,G,B_MODE)	POWER SAVE CONDITION
00b	Disabled mode enables power save
01b	Load program to SRAM mode prevents power save
10b	Run program mode enables power save if there is no PWM activity and command look-ahead filter condition is met
11b	Direct control mode enables power save if there is no PWM activity

COMMAND	POWER SAVE CONDITION
Wait	No PWM activity and current command wait time longer than 50 ms. If prescale = 1 then wait time needs to be longer than 80 ms.
Ramp	Ramp Command PWM value reaches minimum 0 and current command execution time left more than 50 ms. If prescale = 1 then time left needs to be more than 80 ms.
Trigger	No PWM activity during wait for trigger command execution.
End	No PWM activity or Reset bit = 1
Set PWM	Enables power save if PWM set to 0 and next command generates at least 50 ms wait
Other commands	No effect to power save

See application note *LP5521 Power Efficiency Considerations (SNVA185)* for more information.

7.3.4 External Clock Detection

The presence of external clock can be detected by the LP5521. Program execution is clocked with internal 32 kHz clock or with external clock. Clocking is controlled with register address 08H bits, INT_CLK_EN and CLK_DET_EN as seen on the following table.

External clock can be used if clock is present at CLK_32K pin. External clock frequency must be 32 kHz for the program execution / PWM timing to be like specified. If higher or lower frequency is used, it will affect the program engine execution speed. If other than 32 kHz clock frequency is used, the program execution timings must be scaled accordingly. The external clock detector block only detects too low clock frequency (< 15 kHz). If external clock frequency is higher than specified, the external clock detector notifies that external clock is present. External clock status can be checked with read only bit EXT_CLK_USED in register address 0CH, when the external clock detection is enabled (CLK_DET_EN bit = high). If EXT_CLK_USED = 1, then the external clock is detected and it is used for timing, if automatic clock selection is enabled (see Table 7).

If external clock is stuck-at-zero or stuck-at-one, or the clock frequency is too low, the clock detector indicates that external clock is not present.

If external clock is not used on the application, connect the CLK_32K pin to GND to prevent floating of this pin and extra current consumption.

7.3.5 Logic Interface Operational Description

LP5521 features a flexible logic interface for connecting to processor and peripheral devices. Communication is done with I²C compatible interface and different logic input/output pins makes it possible to synchronize operation of several devices.

7.3.5.1 I/O Levels

I²C interface, CLK_32K and TRIG pins input levels are defined by EN pin. Using EN pin as voltage reference for logic inputs simplifies PWB routing and eliminates the need for dedicated V_{IO} pin. Figure 17 describes EN pin connections.

Copyright © 2016, Texas Instruments Incorporated

Figure 17. Using EN Pin as Digital I/O Voltage Reference

ADDR_SEL0/1 are referenced to V_{DD} voltage. GPO pin level is defined by V_{DD} voltage.

7.3.5.2 GPO/INT Pins

LP5521 has one General Purpose Output pin (GPO); the INT pin can also be configured as a GPO pin. When INT is configured as GPO output, its level is defined by the V_{DD} voltage. State of the pins can be controlled with GPO register (0EH). GPO pins are digital CMOS outputs and no pullup or pulldown resistors are needed.

When INT pin GPO function is disabled, it operates as an open drain pin. INT signal is active low; that is, when interrupt signal is sent, the pin is pulled to GND. External pullup resistor is needed for proper functionality.

Table 8. GPO Register (0EH)

NAME	BIT	DESCRIPTION
INT_AS_GPO	2	Enable INT pin GPO function 0 = INT pin functions as a INT pin 1 = INT pin functions as a GPO pin
GPO	1	0 = GPO pin state is low 1 = GPO pin state is high
INT	0	0 = INT pin state is low (INT_AS_GPO=1) 1 = INT pin state is high (INT_AS_GPO=1)

7.3.5.3 TRIG Pin

The TRIG pin can function as an external trigger input or output. External trigger signal is active low; that is, when trigger is sent or received the pin is pulled to GND. TRIG is an open-drain pin and external pullup resistor is needed for trigger line. External trigger input signal must be at least two 32-kHz clock cycles long to be recognized. Trigger output signal is three 32-kHz clock cycles long. If TRIG pin is not used on application, connected the TRIG pin to GND to prevent floating of this pin and extra current consumption.

7.3.5.4 ADDR_SEL0,1 Pins

The ADDR_SEL0,1 pins define the chip I²C address. Pins are referenced to V_{DD} signal level. See [I²C-Compatible Serial Bus Interface](#) for I²C address definitions.

7.3.5.5 CLK_32K Pin

The CLK_32K pin is used for connecting an external 32-kHz clock to LP5521. External clock can be used to synchronize the sequence engines of several LP5521. Using external clock can also improve automatic power save mode efficiency, because internal clock can be switched off automatically when device has entered power save mode, and external clock is present. See application note *LP5521 Power Efficiency Considerations (SNVA185)* for more information.

Device can be used without the external clock. If external clock is not used on the application, connect the CLK_32K pin to GND to prevent floating of this pin and extra current consumption.

LP5521

SNVS441H – JANUARY 2007 – REVISED MAY 2016

www.ti.com

7.4 Device Functional Modes

7.4.1 Modes of Operation

RESET: In the RESET mode all the internal registers are reset to the default values. Reset is done always if Reset Register (0DH) is written FFH or internal power on reset (POR) is activated. POR activates when supply voltage is connected or when the supply voltage V_{DD} falls below 1.5 V typical (0.8 V minimum). Once V_{DD} rises above 1.5 V, POR inactivates, and the chip continues to the STANDBY mode. CHIP_EN control bit is low after POR by default.

STANDBY: The STANDBY mode is entered if the register bit CHIP_EN or EN pin is LOW and Reset is not active. This is the low power consumption mode, when all circuit functions are disabled. Registers can be written in this mode if EN pin is high. Control bits are effective after start-up.

START-UP: When CHIP_EN bit is written high and EN pin is high, the INTERNAL STARTUP SEQUENCE powers up all the needed internal blocks (V_{REF} , bias, oscillator, etc.). Start-up delay is after setting EN pin high is 1 ms (typical). Start-up delay after setting CHIP_EN to 1 is 500 μ s (typical). If the chip temperature rises too high, the thermal shutdown (TSD) disables the chip operation, and the chip state is in START-UP mode until no TSD event is present.⁽¹⁾

NORMAL: During NORMAL mode the user controls the chip using the Control Registers. If EN pin is set low, the CHIP_EN bit is reset to 0.

POWER SAVE: In POWER SAVE mode analog blocks are disabled to minimize power consumption. See [Automatic Power Save](#) for further information.

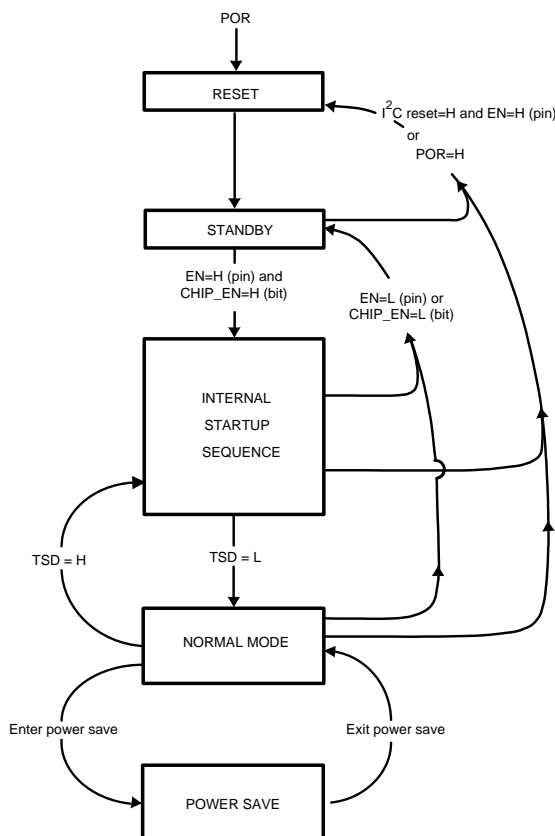

Figure 18. Modes of Operation

(1) Internal thermal shutdown circuitry protects the device from permanent damage. Thermal shutdown engages at $T_J = 150^\circ\text{C}$ (typical) and disengages at $T_J = 130^\circ\text{C}$ (typical).

7.5 Programming

7.5.1 I²C-Compatible Serial Bus Interface

7.5.1.1 Interface Bus Overview

The I²C compatible synchronous serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bidirectional communications between the IC's connected to the bus. The two interface lines are the serial data line (SDA), and the serial clock line (SCL). These lines should be connected to a positive supply, via a pullup resistor and remain HIGH even when the bus is idle.

Every device on the bus is assigned a unique address and acts as either a Master or a Slave depending on whether it generates or receives the serial clock (SCL).

7.5.1.2 Data Transactions

One data bit is transferred during each clock pulse. Data is sampled during the high state of the serial clock (SCL). Consequently, throughout the high period of the clock the data should remain stable. Any changes on the SDA line during the high state of the SCL and in the middle of a transaction, aborts the current transaction. New data should be sent during the low SCL state. This protocol permits a single data line to transfer both command/control information and data using the synchronous serial clock.

Figure 19. Data Validity

Each data transaction is composed of a start condition, a number of byte transfers (set by the software) and a stop condition to terminate the transaction. Every byte written to the SDA bus must be 8 bits long and is transferred with the most significant bit first. After each byte, an acknowledge signal must follow. The following sections provide further details of this process.

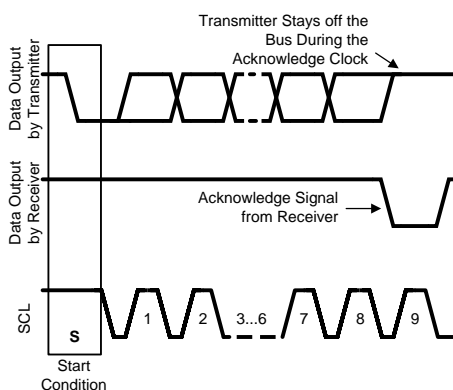

Figure 20. Acknowledge Signal

The Master device on the bus always generates the start and stop conditions (control codes). After a start condition is generated, the bus is considered busy and it retains this status until a certain time after a stop condition is generated. A high-to-low transition of the data line (SDA) while the clock (SCL) is high indicates a start condition. A low-to-high transition of the SDA line while the SCL is high indicates a stop condition.

LP5521

SNVS441H – JANUARY 2007 – REVISED MAY 2016

www.ti.com

Programming (continued)

Figure 21. Start and Stop Conditions

In addition to the first start condition, a repeated start condition can be generated in the middle of a transaction. This allows another device to be accessed, or a register read cycle.

7.5.1.3 Acknowledge Cycle

The acknowledge cycle consists of two signals: the acknowledge clock pulse the master sends with each byte transferred, and the acknowledge signal sent by the receiving device.

The master generates the acknowledge clock pulse on the ninth clock pulse of the byte transfer. The transmitter releases the SDA line (permits it to go high) to allow the receiver to send the acknowledge signal. The receiver must pull down the SDA line during the acknowledge clock pulse and ensure that SDA remains low during the high period of the clock pulse, thus signaling the correct reception of the last data byte and its readiness to receive the next byte.

7.5.1.4 Acknowledge After Every Byte Rule

The master generates an acknowledge clock pulse after each byte transfer. The receiver sends an acknowledge signal after every byte received.

There is one exception to the *acknowledge after every byte* rule. When the master is the receiver, it must indicate to the transmitter an end of data by not-acknowledging (*negative acknowledge*) the last byte clocked out of the slave. This *negative acknowledge* still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

7.5.1.5 Addressing Transfer Formats

Each device on the bus has a unique slave address. The LP5521 operates as a slave device with the 7-bit address. The LP5521 I²C address is pin selectable from four different choices. If 8-bit address is used for programming, the 8th bit is 1 for read and 0 for write. [Table 9](#) shows the 8-bit I²C addresses.

Table 9. 8-Bit I²C Addresses

ADDR_SEL [1:0]	I ² C ADDRESS WRITE (8 bits)	I ² C ADDRESS READ (8 bits)
00	0110 0100 = 64H	0110 0101 = 65H
01	0110 0110 = 66H	0110 0111 = 67H
10	0110 1000 = 68H	0110 1001 = 69H
11	0110 1010 = 6AH	0110 1011 = 6BH

Before any data is transmitted, the master transmits the address of the slave being addressed. The slave device sends an acknowledge signal on the SDA line, once it recognizes its address.

The slave address is the first seven bits after a start condition. The direction of the data transfer (R/W) depends on the bit sent after the slave address — the eighth bit.

When the slave address is sent, each device in the system compares this slave address with its own. If there is a match, the device considers itself addressed and sends an acknowledge signal. Depending upon the state of the R/W bit (1:read, 0:write), the device acts as a transmitter or a receiver.

Figure 22. I²C Chip Address

7.5.1.6 Control Register Write Cycle

- Master device generates start condition.
- Master device sends slave address (7 bits) and the data direction bit (r/w = 0).
- Slave device sends acknowledge signal if the slave address is correct.
- Master sends control register address (8 bits).
- Slave sends acknowledge signal.
- Master sends data byte to be written to the addressed register.
- Slave sends acknowledge signal.
- If master will send further data bytes the control register address is incremented by one after acknowledge signal.
- Write cycle ends when the master creates stop condition.

7.5.1.7 Control Register Read Cycle

- Master device generates a start condition.
- Master device sends slave address (7 bits) and the data direction bit (r/w = 0).
- Slave device sends acknowledge signal if the slave address is correct.
- Master sends control register address (8 bits).
- Slave sends acknowledge signal.
- Master device generates repeated start condition.
- Master sends the slave address (7 bits) and the data direction bit (r/w = 1).
- Slave sends acknowledge signal if the slave address is correct.
- Slave sends data byte from addressed register.
- If the master device sends acknowledge signal, the control register address is incremented by one. Slave device sends data byte from addressed register.
- Read cycle ends when the master does not generate acknowledge signal after data byte and generates stop condition.

	ADDRESS MODE
Data Read	<Start Condition> <Slave Address><r/w = 0>[Ack] <Register Addr.>[Ack] <Repeated Start Condition> <Slave Address><r/w = 1>[Ack] [Register Data]<Ack or NAck> ... additional reads from subsequent register address possible <Stop Condition>
Data Write	<Start Condition> <Slave Address><r/w='0'>[Ack] <Register Addr.>[Ack] <Register Data>[Ack] ... additional writes to subsequent register address possible <Stop Condition>

SNVS441H – JANUARY 2007 – REVISED MAY 2016

www.ti.com

<>Data from master [] Data from slave

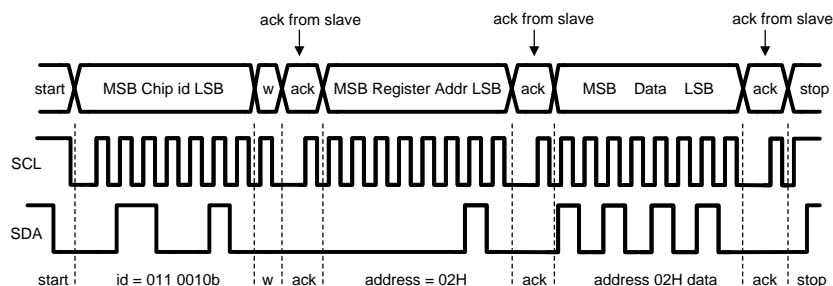

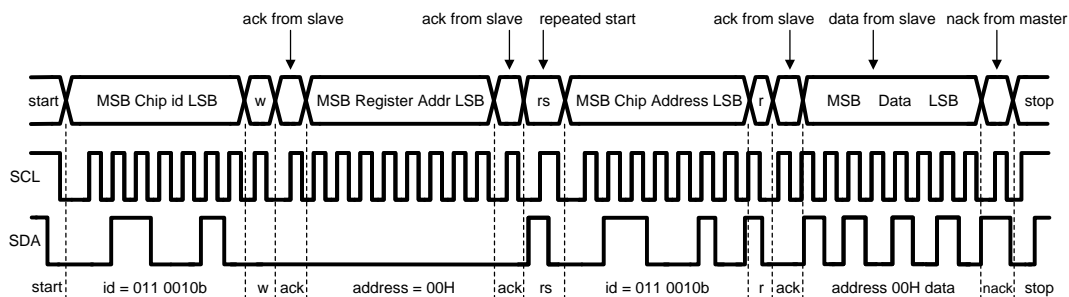

Figure 23. Register Write Format

When a READ function is to be accomplished, a WRITE function must precede the READ function, as shown in Figure 24.

w = write (SDA = 0)
 r = read (SDA = 1)
 ack = acknowledge (SDA pulled down by either master or slave)
 rs = repeated start
 id = 7-bit chip address

Figure 24. Register Read Format

7.5.2 LED Controller Operation Modes

Operation modes are defined in register address 01H. Each output channel (R, G, B) operation mode can be configured separately. MODE registers are synchronized to a 32-kHz clock. Delay between consecutive I²C writes to OP_MODE register (01H) need to be longer than 153 μs (typical).

Table 10. OP_MODE Register (01H):

NAME	BIT	DESCRIPTION
R_MODE	5:4	R channel operation mode 00b = Disabled, reset R channel PC 01b = Load program to SRAM, reset R channel PC 10b = Run program defined by R_EXEC 11b = Direct control, reset R channel PC
G_MODE	3:2	G channel operation mode 00b = Disabled, reset G channel PC 01b = Load program to SRAM, reset G channel PC 10b = Run program defined by G_EXEC 11b = Direct control, reset G channel PC
B_MODE	1:0	B channel operation mode 00b = Disabled, reset B channel PC 01b = Load program to SRAM, reset B channel PC 10b = Run program defined by B_EXEC 11b = Direct control, reset B channel PC

7.5.2.1 Disabled

Each channel can be configured to disabled mode. LED output current is 0 during this mode. Disabled mode resets PC of respective channel.

7.5.2.2 LOAD Program

LP5521 can store 16 commands for each channel (R, G, B). Each command consists of 16 bits. Because one register has only 8 bits, one command requires two I²C register addresses. In order to reduce program load time LP5521 supports address auto incrementation. Register address is incremented after each 8 data bits. Whole program memory can be written in one I²C write sequence.

Program memory is defined in the LP5521 register table, 10H to 2FH for R channel, 30H to 4FH for G channel and 50H to 6FH for B channel. In order to be able to access program memory at least one channel operation mode needs to be LOAD Program.

Memory writes are allowed only to the channel in LOAD mode. All channels are in hold while one or several channels are in LOAD program mode, and PWM values are frozen for the channels which are not in LOAD mode. Program execution continues when all channels are out of LOAD program mode. LOAD Program mode resets PC of respective channel.

7.5.2.3 RUN Program

RUN Program mode executes the commands defined in program memory for respective channel (R, G, B). Execution register bits in ENABLE register define how program is executed. Program start position can be programmed to Program Counter register (see the following tables). By manually selecting the PC start value, user can write different lighting sequences to the memory, and select appropriate sequence with the PC register. If program counter runs to end (15) the next command will be executed from program location 0.

If internal clock is used in the RUN program mode, operation mode needs to be written disabled (00b) before disabling the chip (with CHIP_EN bit or EN pin) to ensure that the sequence starts from the correct program counter (PC) value when restarting the sequence.

PC registers are synchronized to 32 kHz clock. Delay between consecutive I²C writes to PC registers (09H, 0AH, 0BH) need to be longer than 153 μs (typ.).

Note that entering LOAD program or Direct Control Mode from RUN PROGRAM mode is not allowed. Engine execution mode should be set to Hold, and Operation Mode to disabled, when changing operation mode from RUN mode.

PC can be read or written only in this mode. 01b = Step: Execute instruction defined by current G channel PC value, increment PC and change G_EXEC to 00b (Hold) 10b = Run: Start at program counter value defined by current G channel PC value 11b = Execute instruction defined by current G channel PC value and change G_EXEC to 00b (Hold)

LP5521

SNVS441H – JANUARY 2007 – REVISED MAY 2016

www.ti.com

Table 12. ENABLE Register (00H) (continued)

NAME	BIT	DESCRIPTION
B_EXEC	1:0	B channel program execution 00b = Hold: Wait until current command is finished then stop while EXEC mode is hold. PC can be read or written only in this mode. 01b = Step: Execute instruction defined by current B channel PC value, increment PC and change B_EXEC to 00b (Hold) 10b = Run: Start at program counter value defined by current B channel PC value 11b = Execute instruction defined by current B channel PC value and change B_EXEC to 00b (Hold)

EXEC registers are synchronized to 32-kHz clock. Delay between consecutive I²C writes to ENABLE register (00H) need to be longer than 488 μs (typ.).

7.5.2.3.1 DIRECT Control

When R, G or B channel mode is set to 11b, the LP5521 drivers work in direct control mode. LP5521 LED channels can be controlled independently through I²C. For each channel there is a PWM control register and an output current control register. With output current control register is set what is the maximum output current with 8-bit resolution, step size is 100 μA. Duty cycle can be set with 8-bit resolution. Direct control mode resets respective channel's PC. PWM control bits are presented in [Table 13](#):

Table 13. R_PWM Register (02H), G_PWM Register (03H), B_PWM Register (04H):

NAME	BIT	DESCRIPTION
PWM	7:0	LED PWM value during direct control operation mode 0000 0000b = 0% 1111 1111b = 100%

If charge pump automatic gain change is used in this mode, then PWM values need to be written 0 before changing the drivers' operation mode to disabled (00b) to ensure proper automatic gain change operation.

7.5.3 LED Controller Programming Commands

LP5521 has three independent programmable channels (R, G, B). Trigger connections between channels are common for all channels. All channels have own program memories for storing complex patterns. Brightness control and patterns are done with 8-bit PWM control (256 steps) to get accurate and smooth color control.

Program execution is timed with 32 768 Hz clock. This clock can be generated internally or external 32 kHz clock can be connected to CLK_32K pin. Using external clock enables synchronization of LED timing to this clock rather than internal clock. Selection of the clock is made with address 08H bits INT_CLK_EN and CLK_DET_EN. See [External Clock Detection](#) for details.

Supported commands are listed in [Table 14](#). **Command compiler is available for easy sequence programming. With Command compiler it is possible to write sequences with simple ASCII commands, which are then converted to binary or hex format. See application note "LP5521 Programming Considerations" for examples of Command compiler usage.**

Table 14. LED Controller Programming Commands

Command	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Ramp Wait	0	Pre-scale	Step time						Sign	Increment (number of steps)							
Set PWM	0	1	0						PWM Value								
Go to Start	0	0	0						0	0	0	0	0	0	0	0	0
Branch	1	0	1	Loop count						x	Step / command number						
End	1	1	0	Int	Reset	X											
Trigger	1	1	1	Wait for trigger on channels 5-0						Send trigger on channels 5-0						X	

X means do not care whether 1 or 0.

7.5.3.1 RAMP/WAIT

Ramp command generates a PWM ramp starting from current value. At each ramp step the output is incremented by one. Time for one step is defined with Prescale and Step time bits. Minimum time for one step is 0.49 ms and maximum time is $63 \times 15.6 \text{ ms} = 1 \text{ second/step}$, so it is possible to program very fast and also very slow ramps. Increment value defines how many steps are taken in one command. Number of actual steps is Increment + 1. Maximum value is 127d, which corresponds to half of full scale (128 steps). If during ramp command PWM reaches minimum/maximum (0/255) ramp command is executed to the end, and PWM stays at minimum/maximum. This enables ramp command to be used as combined ramp and wait command in a single instruction.

Ramp command can be used as wait instruction when increment is zero.

Setting register 00H bit LOG_EN sets the scale from linear to logarithmic. When LOG_EN = 0 linear scale is used, and when LOG_EN = 1 logarithmic scale is used. By using logarithmic scale the visual effect of the ramp command seems linear to the eye.

Table 15. Ramp/Wait Command

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Pre-scale	Step time						Sign	Increment						

NAME	VALUE(d)	DESCRIPTION
Prescale	0	Divides master clock (32 768Hz) by 16 = 2048 Hz, 0.49 ms cycle time
	1	Divides master clock (32 768Hz) by 512 = 64 Hz, 15.6 ms cycle time
Step time	1-63	One ramp increment done in (step time) x (clock after prescale) Note: 0 means Set PWM command.
Sign	0	Increase PWM output
	1	Decrease PWM output
Increment	0-127	The number of steps is Increment + 1. Note: 0 is a wait instruction.

Application example:

For example if following parameters are used for ramp:

- Prescale = 1 → cycle time = 15.6 ms
- Step time = 2 → time = 15.6 ms x 2 = 31.2 ms
- Sign = 0 → rising ramp
- Increment = 4 → 5 cycles

Ramp command will be: 0100 0010 0000 0100b = 4204H

If current PWM value is 3, and the first command is as described above and next command is a ramp with otherwise same parameters, but with Sign = 1 (Command = 4284H), the result will be like in Figure 25:

Figure 25. Example of 2 Sequential Ramp Commands.

LP5521

SNVS441H – JANUARY 2007 – REVISED MAY 2016

www.ti.com

7.5.3.2 Set PWM

Set PWM output value from 0 to 255. Command takes sixteen 32 kHz clock cycles (= 488 μs). Setting register 00H bit LOG_EN sets the scale from linear to logarithmic.

Table 16. Set PWM Command

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	0	0	0	PWM value							

7.5.3.3 Go to Start

Go to start command resets Program Counter register and continues executing program from the 00H location. Command takes sixteen 32 kHz clock cycles. Note that default value for all program memory registers is 0000H, which is Go to start command.

Go to start command															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

7.5.3.4 Branch

When branch command is executed, the 'step number' value is loaded to PC and program execution continues from this location. Looping is done by the number defined in loop count parameter. Nested looping is supported (loop inside loop). The number of nested loops is not limited. Command takes sixteen 32-kHz clock cycles.

Table 17. Branch Command

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
1	0	1	Loop count						X	X	X	Step number				

NAME	VALUE(d)	DESCRIPTION
loop count	0-63	The number of loops to be done. 0 means infinite loop.
step number	0-15	The step number to be loaded to program counter.

7.5.3.5 End

End program execution, resets the program counter and sets the corresponding EXEC register to 00b (hold). Command takes sixteen 32-kHz clock cycles.

Table 18. End Command

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	0	int	reset	X	X	X	X	X	X	X	X	X	X	X

NAME	VALUE	DESCRIPTION
int	0	No interrupt will be sent.
	1	Send interrupt to processor by pulling the INT pin down and setting corresponding status register bit high to notify that program has ended. Interrupt can only be cleared by reading interrupt status register 0CH.
reset	0	Keep the current PWM value.
	1	Set PWM value to 0.

X means do not care whether 1 or 0.

7.5.3.6 Trigger

Wait or send triggers can be used to, for example, synchronize operation between different channels. Send trigger command takes sixteen 32-kHz clock cycles, and wait for trigger takes at least sixteen 32 kHz clock cycles. The receiving channel stores sent triggers. Received triggers are cleared by wait for trigger command if received triggers match to channels defined in the command. Channel waits for until all defined triggers have been received.

External trigger input signal must be at least two 32-kHz clock cycles (= 61 μs typical) long to be recognized. Trigger output signal is three 32-kHz clock cycles (92 μs typical) long. External trigger signal is active low; that is, when trigger is sent/received the pin is pulled to GND. Sent external trigger is masked; that is, the device which has sent the trigger does not recognize it. If send and wait external trigger are used on the same command, the send external trigger is executed first, then the wait external trigger.

Table 19. Trigger Command

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	wait trigger <5:0>					send trigger <5:0>					X		
			EXT	X	B	G	R	EXT	X	B	G	R			

NAME	VALUE(d)	DESCRIPTION
wait trigger<5:0>	0-31	Wait for trigger for the channel(s) defined. Several triggers can be defined in the same command. Bit 0 is R, bit 1 is G, bit 2 is B and bit 5 is external trigger I/O. Bits 3 and 4 are not in use.
send trigger<5:0>	0-31	Send trigger for the channel(s) defined. Several triggers can be defined in the same command. Bit 0 is R, bit 1 is G, bit 2 is B and bit 5 is external trigger I/O. Bits 3 and 4 are not in use.

X means do not care whether 1 or 0.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

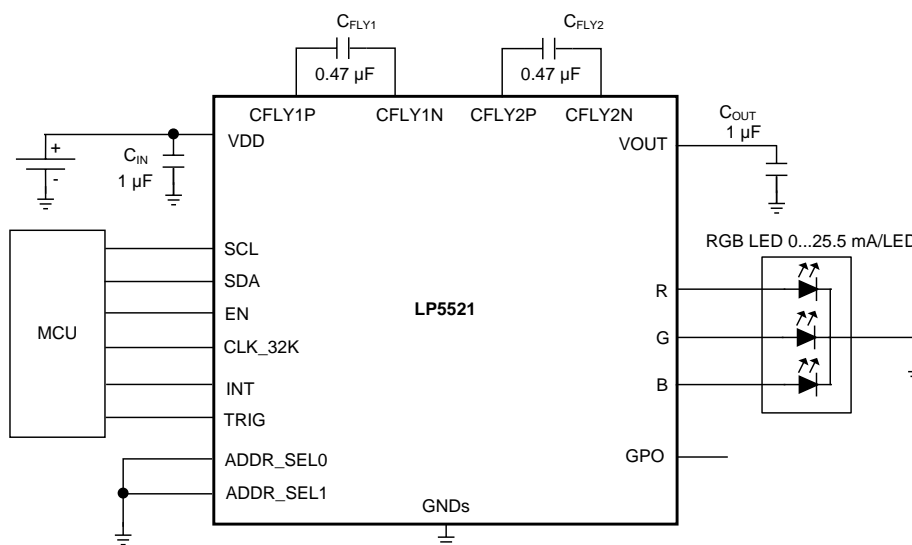

8.1 Application Information

The LP5521 is designed as a autonomous lighting controller for mobile devices. These devices need extremely small form factor; therefore, the LP5521 is designed to require only 4 small capacitors: input, output, and two fly-capacitors for charge pump. If charge pump is not needed in the application (input voltage is high enough for driving LEDs), the charge pump capacitors can be omitted thus reducing the solution size even further. LED can be RGB LED or any color if desired.

8.2 Typical Applications

[Application with Charge Pump](#) shows an example of typical application which uses charge pump to get high enough voltage to drive LEDs. The device is powered from single Li-Ion battery with voltage range of 2.7 V to 4.2 V.

8.2.1 Application with Charge Pump

Copyright © 2016, Texas Instruments Incorporated

Figure 26. LP5521 Typical Application Schematic With Charge Pump

8.2.1.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	2.7 V to 4.2 V (single Li-Ion cell battery)
LED V_F (maximum)	3.6 V
LED current	25.5 mA maximum
Input capacitor	$C_{IN} = 1 \mu F$
Output capacitor	$C_{OUT} = 1 \mu F$
Fly capacitors	$C_{FLY1} = C_{FLY2} = 470 \text{ nF}$
Charge pump mode	Automatic or 1.5x

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Capacitor Selection

The LP5521 requires 4 external capacitors for proper operation ($C_{IN} = C_{OUT} = 1 \mu\text{F}$, $C_{FLY1} = C_{FLY2} = 470 \text{ nF}$). Surface-mount multi-layer ceramic capacitors are recommended. These capacitors are small, inexpensive and have very low equivalent series resistance ($\text{ESR} < 20 \text{ m}\Omega$ typical). Tantalum capacitors, OS-CON capacitors, and aluminum electrolytic capacitors are not recommended for use with the LP5521 due to their high ESR, as compared to ceramic capacitors.

For most applications, ceramic capacitors with X7R or X5R temperature characteristic are preferred for use with the LP5521. These capacitors have tight capacitance tolerance (as good as $\pm 10\%$) and hold their value over temperature (X7R: $\pm 15\%$ over -55°C to 125°C ; X5R: $\pm 15\%$ over -55°C to 85°C).

Capacitors with Y5V or Z5U temperature characteristic are generally not recommended for use with the LP5521. Capacitors with these temperature characteristics typically have wide capacitance tolerance ($+80\%$, -20%) and vary significantly over temperature (Y5V: $+22\%$, -82% over -30°C to $+85^\circ\text{C}$ range; Z5U: $+22\%$, -56% over $+10^\circ\text{C}$ to $+85^\circ\text{C}$ range). Under some conditions, a nominal $1\text{-}\mu\text{F}$ Y5V or Z5U capacitor could have a capacitance of only $0.1 \mu\text{F}$. Such detrimental deviation is likely to cause Y5V and Z5U capacitors to fail to meet the minimum capacitance requirements of the LP5521.

The minimum voltage rating acceptable for all capacitors is 6.3 V. The recommended voltage rating of the output capacitor is 10 V to account for DC bias capacitance losses.

NOTE

Some ceramic capacitors, especially those in small packages, exhibit a strong capacitance reduction with the increased applied voltage (DC bias effect). The capacitance value can fall below half of the nominal capacitance. Choose output and input capacitor with DC bias voltage effect better than -50% at 5 V voltage ($0.5 \mu\text{F}$ at 5 V).

Table 36. External Component Examples

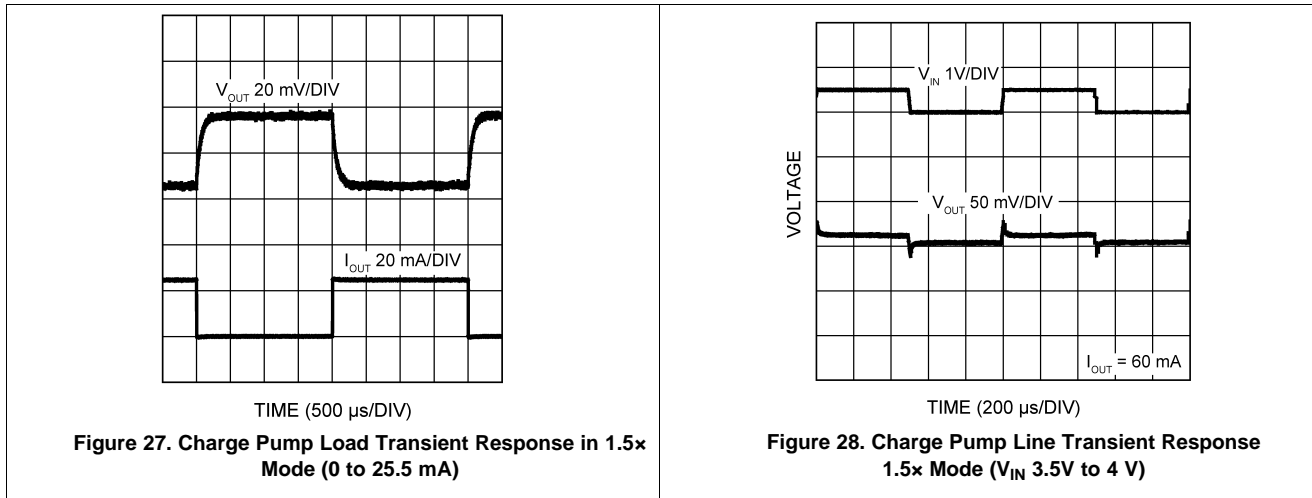

MODEL	TYPE	VENDOR	VOLTAGE RATING	SIZE INCH (mm)

SNVS441H – JANUARY 2007 – REVISED MAY 2016

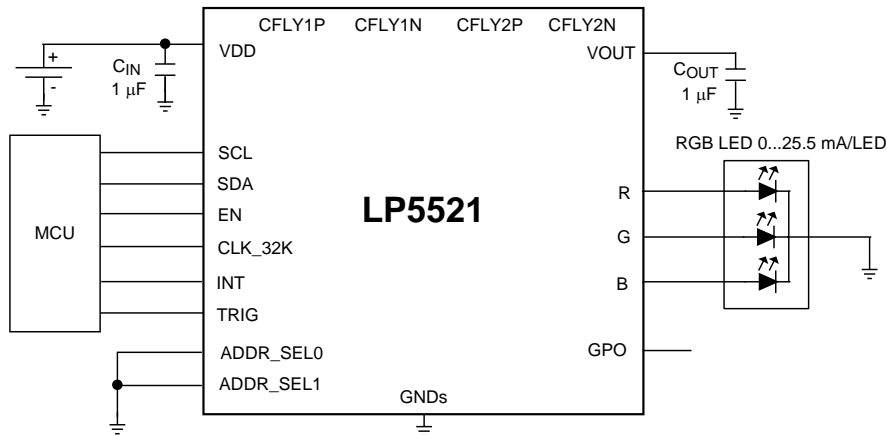

www.ti.com

8.2.1.3 Application Curves

8.2.2 Application Without Charge Pump

In this application example the input voltage is high enough to drive the LEDs even without charge pump. In that case the charge pump components are omitted, allowing savings on bill-of-material and also board space. Charge pump must be set to 1x mode (bypass) in this case.

Copyright © 2016, Texas Instruments Incorporated

Figure 29. Typical Application Schematic Without Charge Pump

8.2.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	4.5 V to 5.5 V
LED V_F (max)	3.6 V
LED current	25.5 mA maximum
Input capacitor	$C_{IN} = 1 \mu F$
Output capacitor	$C_{OUT} = 1 \mu F$
Fly capacitors	none
Charge pump mode	1X

8.2.2.2 Detailed Design Procedures

Selecting input and output capacitors follows the same procedure as in the application with charge pump.

8.3 Initialization Setup

8.3.1 Program Load and Execution Example

1. Startup Device and Configure Device to SRAM Write Mode:

- Supply e.g. 3.6 V to VDD
- Supply e.g. 1.8 V to EN
- Wait 1 ms (startup delay)
- Generate 32 kHz clock to CLK_32K pin
- Write to address 00H 0100 0000b (enable LP5521)
- Wait 500 μs (startup delay)
- Write to address 01H 0001 0000b (Configure R channel into "Load program to SRAM" mode)

2. Program Load to SRAM (see Figure 30):

- Write to address 10H 0000 0011b (1st ramp command 8 MSB)
- Write to address 11H 0111 1111b (1st ramp command 8 LSB)
- Write to address 12H 0100 1101b (1st wait command 8 MSB)
- Write to address 13H 0000 0000b (1st wait command 8 LSB)
- Write to address 14H 0000 0011b (2nd ramp command 8 MSB)
- Write to address 15H 1111 1111b (2nd ramp command 8 LSB)
- Write to address 16H 0110 0000b (2nd wait command 8 MSB)
- Write to address 17H 0000 0000b (2nd wait command 8 LSB)

3. Enable Powersave, charge pump automatic mode (1x / 1.5x) and use external 32 kHz clock:

- Write to address 08H 0011 1000b

4. Run program:

- Write to address 01H 0010 0000b (Configure LED controller operation mode to "Run program" in R channel)
- Write to address 00H 0110 0000b (Configure program execution mode from "Hold" to "Run" in R channel)

LP5521 will generate 1100 ms long LED pattern which will be repeated infinitely. LED pattern is illustrated in Figure 30.

Figure 30. Sequence Diagram

8.3.2 Direct PWM Control Example

1. Start up device:

- Supply, for example, 3.6 V to VDD
- Supply, for example, 1.8 V to EN
- Wait 1 ms (start-up delay)
- Write to address 00H 0100 0000b (enable LP5521)

LP5521

SNVS441H – JANUARY 2007 – REVISED MAY 2016

www.ti.com

Initialization Setup (continued)

- Wait 500 μ s (start-up delay)
- 2. **Enable charge pump 1.5x mode and use internal clock:**
 - Write to address 08H 0001 0001b
- 3. **Direct PWM control:**
 - Write to address 01H 0011 1111b (Configure R, G and B channels into "Direct PWM control mode")
- 4. **Write PWM values:**
 - Write to address 02H 1000 0000b (R driver PWM 50% duty cycle)
 - Write to address 03H 1100 0000b (G driver PWM 75% duty cycle)
 - Write to address 04H 1111 1111b (B driver PWM 100% duty cycle)

LEDs are turned on after the PWM values are written. Changes to the PWM value registers are reflected immediately to the LED brightness. Default LED current (17.5 mA) is used for LED outputs, if no other values are written.

9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range between 2.7 V and 5.5V. In a typical application this is from single Li-ion battery cell. This input supply must be well regulated and able to withstand maximum input current and maintain stable voltage without voltage drop even at load transition condition (start-up or rapid brightness change). The resistance of the input supply rail must be low enough that the input current transient does not cause drop below a 2.7-V level in the LP5521 supply voltage.

10 Layout

10.1 Layout Guidelines

Place capacitors as close to the LP5521 device as possible to minimize the current loops. [Figure 31](#) shows an example of LP5521 PCB layout and component placement.

10.2 Layout Example

Figure 31. Example of Typical Layout

11 Device and Documentation Support

11.1 Device Support

11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

11.2 Documentation Support

11.2.1 Related Documentation

See application note *LP5521 Programming Considerations* (SNVA205) for more information about programming of the device.

See application note *LP5521 Power Efficiency Consideration* (SNVA185) for more information about powering the device and partitioning the system.

See user guide *LP5521TM Evaluation Kit* (SNVA241) for more information about evaluation kit for LP5521TM.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

E2E is a trademark of Texas Instruments.
 All other trademarks are the property of their respective owners.

11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LP5521TM/NOPB	ACTIVE	DSBGA	YFQ	20	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-30 to 85	5521	Samples
LP5521TMX/NOPB	ACTIVE	DSBGA	YFQ	20	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-30 to 85	5521	Samples
LP5521YQ/NOPB	ACTIVE	WQFN	NJA	24	1000	Green (RoHS & no Sb/Br)	CU SNAGCU	Level-1-260C-UNLIM	-30 to 85	L5521YQ	Samples
LP5521YQX/NOPB	ACTIVE	WQFN	NJA	24	4500	Green (RoHS & no Sb/Br)	CU SNAGCU	Level-1-260C-UNLIM	-30 to 85	L5521YQ	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer’s risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
