16-Channel, Constant-Current LED Driver

Check for Samples: TLC59281

FEATURES

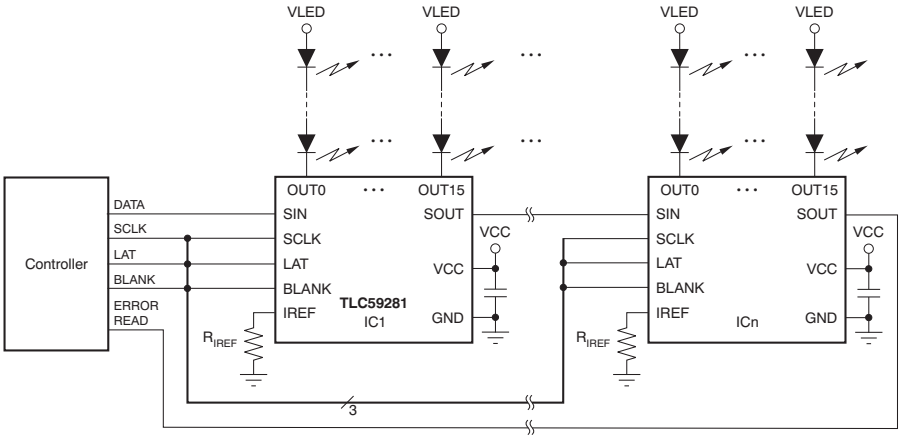
- **16 Channels, Constant-Current Sink Output with On/Off Control**
- **35-mA Capability (Constant-Current Sink)**
- **10-ns High-Speed Constant-Current Switching Transient Time**
- **Low On-Time Error**
- **LED Power-Supply Voltage up to 17 V**
- **V_{CC} = 3.0 V to 5.5 V**
- **Constant-Current Accuracy:**
  - **Channel-to-Channel = ±1%**
  - **Device-to-Device = ±1%**
- **CMOS Logic Level I/O**
- **35-MHz Data Transfer Rate**
- **20-ns BLANK Pulse Width**
- **Operating Temperature: –40°C to +85°C**

APPLICATIONS

- **LED Video Displays**
- **Message Boards**
- **Illumination**

DESCRIPTION

The TLC59281 is a 16-channel, constant-current sink LED driver. Each channel can be turned on/off by writing serial data to an internal register. The constant-current value of all 16 channels is set by a single external resistor.



Typical Application Circuit (Multiple Daisy-Chained TLC59281s)

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION(1)

PRODUCT	PACKAGE-LEAD	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
TLC59281	SSOP-24/QSOP-24	TLC59281DBQR	Tape and Reel, 2500
		TLC59281DBQ	Tube, 50
TLC59281	QFN-24	TLC59281RGER	Tape and Reel, 3000
		TLC59281RGE	Tape and Reel, 250

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

ABSOLUTE MAXIMUM RATINGS(1)(2)

Over operating free-air temperature range, unless otherwise noted.

PARAMETER			TLC59281	UNIT
V_{CC}	Supply voltage: V_{CC}		–0.3 to +6.0	V
I_{OUT}	Output current (dc)	OUT0 to OUT15	40	mA
V_{IN}	Input voltage range	SIN, SCLK, LAT, BLANK, IREF	–0.3 to V_{CC} + 0.3	V
V_{OUT}	Output voltage range	SOUT	–0.3 to V_{CC} + 0.3	V
		OUT0 to OUT15	–0.3 to +18	V
$T_{J(MAX)}$	Operating junction temperature		+150	°C
T_{STG}	Storage temperature range		–55 to +150	°C
	ESD rating	Human body model (HBM)	2	kV
		Charged device model (CDM)	500	V

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.
(2) All voltage values are with respect to network ground terminal.

DISSIPATION RATINGS

PACKAGE	OPERATING FACTOR ABOVE T_A = +25°C	T_A < +25°C POWER RATING	T_A = +70°C POWER RATING	T_A = +85°C POWER RATING
SSOP-24/QSOP-24	14.3 mW/°C	1782 mW	1140 mW	927 mW
QFN-24(1)	24.8 mW/°C	3106 mW	1988 mW	1615 mW

(1) The package thermal impedance is calculated in accordance with JESD51-5.

RECOMMENDED OPERATING CONDITIONS

At T_A= –40°C to +85°C, unless otherwise noted.

ELECTRICAL CHARACTERISTICS

At V_{CC} = 3.0 V to 5.5 V and T_A = –40°C to +85°C. Typical values at V_{CC} = 3.3 V and T_A = +25°C, unless otherwise noted.

PARAMETER		TEST CONDITIONS	TLC59281			UNIT
			MIN	TYP	MAX	
V_{OH}	High-level output voltage	I_{OH} = –1 mA at SOUT	V_{CC} – 0.4		V_{CC}	V
V_{OL}	Low-level output voltage	I_{OL} = 1 mA at SOUT	0		0.4	V
I_{IN}	Input current	V_{IN} = V_{CC} or GND at SIN, SCLK, LAT, and BLANK	–1		1	µA
I_{CC1}	Supply current (V_{CC})	SIN/SCLK/LAT = low, BLANK = high, V_{OUTn} = 1 V, R_{IREF} = 27 kΩ		1	2	mA
I_{CC2}		SIN/SCLK/LAT = low, BLANK = high, V_{OUTn} = 1 V, R_{IREF} = 3 kΩ		4.5	8	mA
I_{CC3}		SIN/SCLK/LAT/BLANK = low, V_{OUTn} = 1 V, R_{IREF} = 3 kΩ		7	18	mA
I_{CC4}		SIN/SCLK/LAT/BLANK = low, V_{OUTn} = 1 V, R_{IREF} = 1.5 kΩ		16	40	mA
I_{OLC}	Constant output current	All OUTn = ON, V_{OUTn} = V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ (see Figure 6), at OUT0 to OUT15	31	34	37	mA
I_{OLKG}	Output leakage current	All OUTn for constant-current driver, all outputs off BLANK = high, V_{OUTn} = V_{OUTfix} = 17 V, R_{IREF} = 1.5 kΩ (see Figure 6), at OUT0 to OUT15			0.1	µA
ΔI_{OLC}	Constant-current error (channel-to-channel)(1)	All OUTn = ON, V_{OUTn} = V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ at OUT0 to OUT15		±1	±3	%
ΔI_{OLC1}	Constant-current error (device-to-device)(2)	All OUTn = ON, V_{OUTn} = V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ at OUT0 to OUT15		±1	±6	%
ΔI_{OLC2}	Line regulation(3)	All OUTn = ON, V_{OUTn} = V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ at OUT0 to OUT15		±0.5	±1	%/V
ΔI_{OLC3}	Load regulation(4)	All OUTn = ON, V_{OUTn} = 1 V to 3V, V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ, at OUT0 to OUT15		±1	±3	%/V
V_{IREF}	Reference voltage output	R_{IREF} = 1.5 kΩ	1.16	1.20	1.24	V

(1) The deviation of each output from the average of OUT0–OUT15 constant-current. Deviation is calculated by the formula:

$$\Delta\,(\%) = \left(\frac{I_{OUTn}}{\frac{(I_{OUT0} + I_{OUT1} + \ldots + I_{OUT14} + I_{OUT15})}{16}} - 1 \right) \times 100$$

(2) The deviation of the OUT0–OUT15 constant-current average from the ideal constant-current value. Deviation is calculated by the following formula:

$$\Delta\,(\%) = \left(\frac{\frac{(I_{OUT0} + I_{OUT1} + \ldots I_{OUT14} + I_{OUT15})}{16} - (\text{Ideal Output Current})}{\text{Ideal Output Current}} \right) \times 100$$

Ideal current is calculated by the formula:

$$I_{OUT(IDEAL)} = 42 \times \left(\frac{1.20}{R_{IREF}} \right)$$

(3) Line regulation is calculated by this equation:

$$\Delta\,(\%/V) = \left(\frac{(I_{OUTn} \text{ at } V_{CC} = 5.5 \text{ V}) - (I_{OUTn} \text{ at } V_{CC} = 3.0 \text{ V})}{(I_{OUTn} \text{ at } V_{CC} = 3.0 \text{ V})} \right) \times \frac{100}{5.5 \text{ V} - 3 \text{ V}}$$

(4) Load regulation is calculated by the equation:

$$\Delta\,(\%/V) = \left(\frac{(I_{OUTn} \text{ at } V_{OUTn} = 3 \text{ V}) - (I_{OUTn} \text{ at } V_{OUTn} = 1 \text{ V})}{(I_{OUTn} \text{ at } V_{OUTn} = 1 \text{ V})} \right) \times \frac{100}{3 \text{ V} - 1 \text{ V}}$$

SWITCHING CHARACTERISTICS

At V_{CC} = 3.0 V to 5.5 V, T_A = –40°C to +85°C, C_L = 15 pF, R_L = 130 Ω, R_{IREF} = 1.5 kΩ, and V_{LED} = 5.5 V. Typical values at V_{CC} = 3.3 V and T_A = +25°C, unless otherwise noted.

PARAMETER		TEST CONDITIONS	TLC59281			UNIT
			MIN	TYP	MAX	
t_{R0}	Rise time	SOUT (see Figure 5)		5	15	ns
t_{R1}		OUTn (see Figure 4)		10	30	ns
t_{F0}	Fall time	SOUT (see Figure 5)		5	15	ns
t_{F1}		OUTn (see Figure 4)		10	30	ns
t_{D0}	Propagation delay time	SCLK↑ to SOUT		8	20	ns
t_{D1}		LAT↑ or BLANK↓ to OUTn sink current on (see Figure 10)		12	30	ns
t_{D2}		LAT↑ or BLANK↑ to OUTn sink current off (see Figure 10)		12	30	ns
t_{ON_ERR}	Output on-time error(1)	On/off latch data = all '1', 20 ns BLANK low level one-shot pulse input (see Figure 4)	–8		+8	ns

(1) Output on-time error (t_{ON_ERR}) is calculated by the formula: t_{ON_ERR} (ns) = t_{OUT_ON} – BLANK low level one-shot pulse width (T_{WL2}). t_{OUT_ON} indicates the actual on-time of the constant-current driver.

TERMINAL FUNCTIONS

TERMINAL			I/O	DESCRIPTION
NAME	DBQ	RGE		
SIN	2	23	I	Serial data input for driver on/off control. When SIN = high level, data '1' are written into LSB of the on/off control shift register at the rising edge of SCLK.
SCLK	3	24	I	Serial data shift clock. Schmitt buffer input. All data in the on/off control shift register are shifted toward the MSB by 1-bit synchronization of SCLK. A rising edge on SCLK is allowed 100 ns after a rising edge of LAT.
LAT	4	1	I	Edge triggered latch. The data in the on/off control data shift register are transferred to the on/off control data latch at this rising edge. At the same time, the data in the on/off control shift register are replaced with TI reserved data for production test. LAT must be toggled only once after the shift data are updated to avoid the on/off control latch data being replaced with TI reserved data in the shift register. The reserved data is not a fixed number.
BLANK	21	18	I	Blank, all outputs. When BLANK = high level, all constant-current outputs (OUT0–OUT15) are forced off. When BLANK = low level, all constant-current outputs are controlled by the on/off control data in the data latch.
IREF	23	20	I/O	Constant-current value setting, OUT0–OUT15 sink constant-current is set to desired value by connection to an external resistor between IREF and GND.
SOUT	22	19	O	Serial data output. This output is connected to the MSB of the on/off data shift register. SOUT data changes at the rising edge of SCLK.
OUT0	5	2	O	Constant-current output. Each output can be tied together with others to increase the constant-current. Different voltages can be applied to each output.
OUT1	6	3	O	Constant-current output
OUT2	7	4	O	Constant-current output
OUT3	8	5	O	Constant-current output

CONSTANT-CURRENT OUTPUT VOLTAGE WAVEFORM

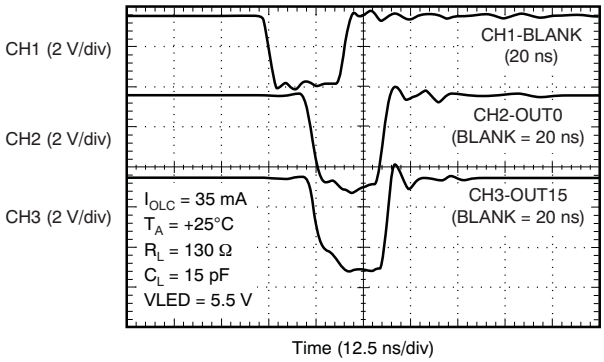

Figure 16.

DETAILED DESCRIPTION

SETTING FOR THE CONSTANT SINK CURRENT VALUE

The constant-current values are determined by an external resistor (R_{IREF}) placed between IREF and GND. The resistor (R_{IREF}) value is calculated by Equation 1.

$$R_{IREF}\ (k\Omega) = \frac{V_{IREF}\ (V)}{I_{OLC}\ (mA)} \times 42$$

Where:

V_{IREF} = the internal reference voltage on the IREF pin (typically 1.20 V) (1)

I_{OLC} must be set in the range of 2 mA to 35 mA. The constant sink current characteristic for the external resistor value is shown in Figure 10. Table 1 describes the constant-current output versus external resistor value.

Table 1. Constant-Current Output versus External Resistor Value

I_{OLCMax} (mA, Typical)	R_{IREF} (kΩ)
35	1.44
30	1.68
25	2.02
20	2.52
15	3.36
10	5.04
5	10.1
2	25.2

CONSTANT-CURRENT DRIVER ON/OFF CONTROL

When BLANK is low, the corresponding output is turned on if the data in the on/off control data latch are '1' and remains off if the data are '0'. When BLANK is high, all outputs are forced off. This control is shown in Table 2.

Table 2. On/Off Control Data Truth Table

ON/OFF CONTROL LATCH DATA	CONSTANT-CURRENT OUTPUT STATUS
0	Off
1	On

When the IC is initially powered on, the data in the on/off control shift register and data latch are not set to the respective default value. Therefore, the on/off control data must be written to the data latch before turning the constant-current output on. BLANK should be at a high level when powered on because the constant-current may be turned on as a result of random data in the on/off control latch.

The on/off data corresponding to any unconnected OUTn outputs should be set to ‘0’ before turning on the remaining outputs. Otherwise, the supply current (I_{CC}) increases while the LEDs are on.

REGISTER CONFIGURATION

The TLC59281 has an on/off control data shift register and data latch. Both the on/off control shift register and latch are 16 bits long and are used to turn the constant-current drivers on and off. Figure 17 shows the shift register and latch configuration. The data at the SIN pin are shifted in to the LSB of the shift register at the rising edge of the SCLK pin; SOUT data change at the rising edge of SCLK. The timing diagram for data writing is shown in Figure 18. The driver on/off is controlled by the data in the on/off control data latch.

The on/off data are latched into the data latch by a rising edge of LAT after the data are written into the on/off control shift register by SIN and SCLK. At the same time, the data in the on/off control shift register are replaced with TI reserved data for production test. Therefore, LAT must be input only once after the on/off data update to avoid the on/off control data latch being replaced with TI reserved data in the shift register. When the IC initially powers on, the data in the on/off control shift register and latch are not set to the default values; on/off control data must be written to the on/off control data latch before turning the constant-current output on. BLANK should be high when the IC is powered on because the constant-current may be turned on at that time as a result of random values in the on/off data latch. All constant-current outputs are forced off when BLANK is high.

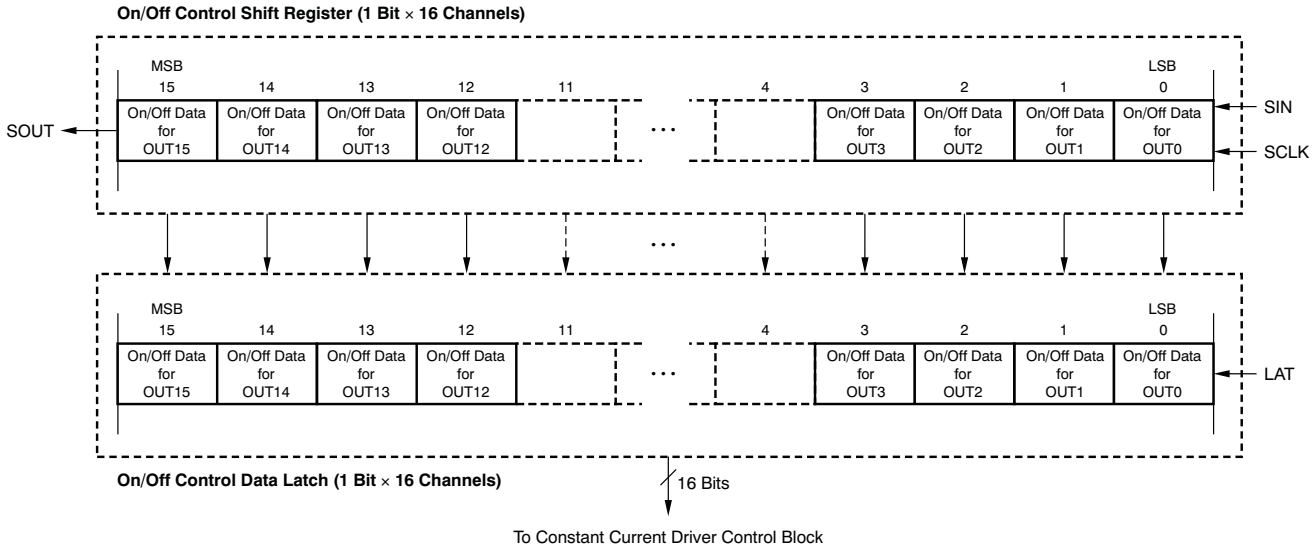

Figure 17. On/Off Control Shift Register and Latch Configuration

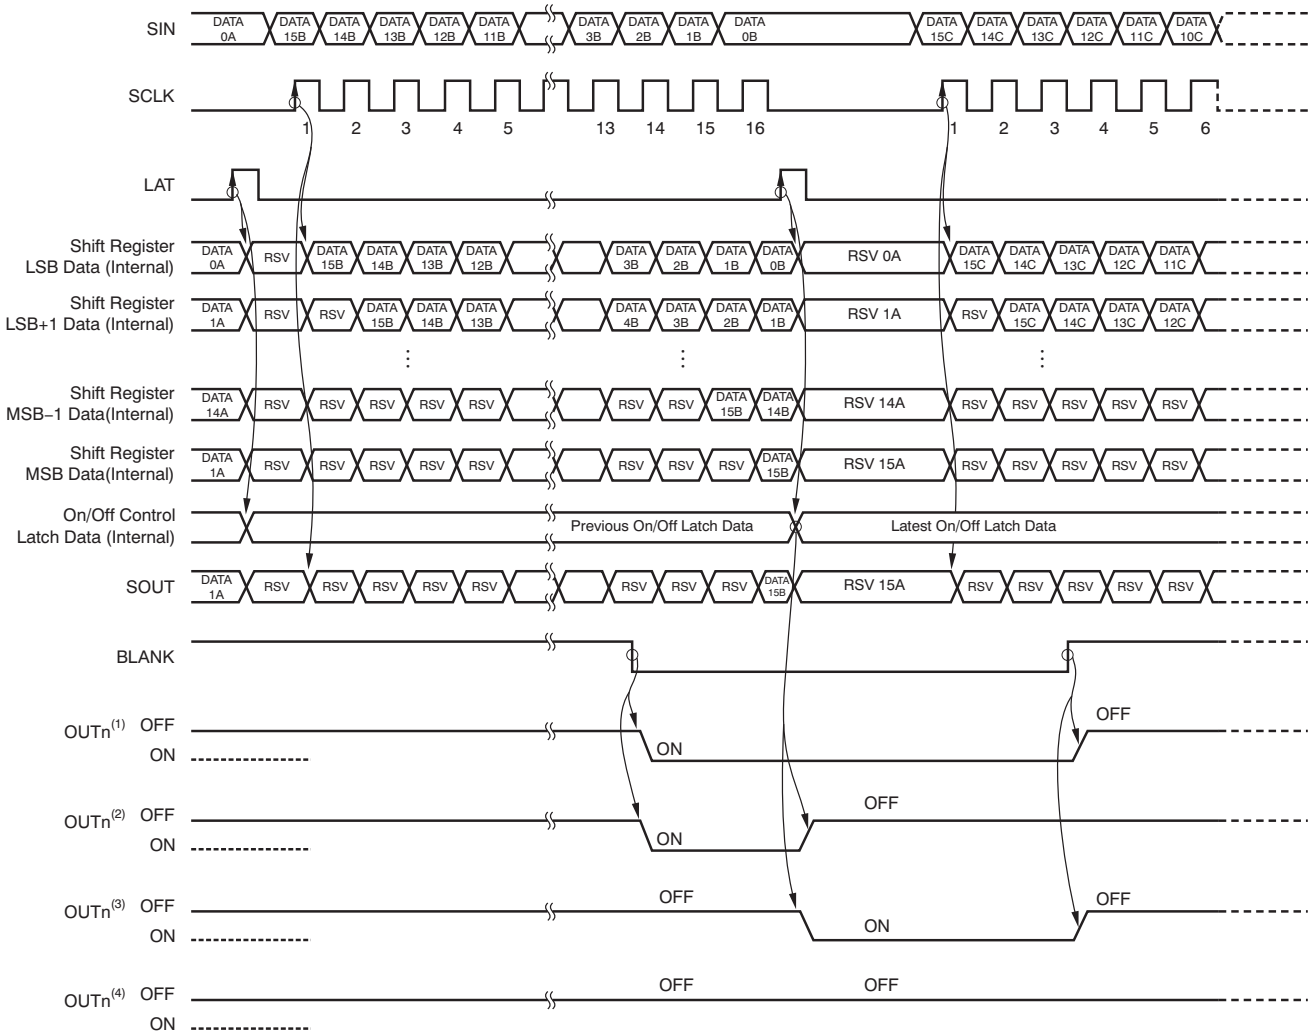

(1) On/off latched data are '1'.

(2) On/off latched data are changed from '1' to '0' at the second LAT signal.

(3) On/off latched data are changed from '0' to '1' at the second LAT signal.

(4) On/off latched data are '0'.

Figure 18. On/Off Control Operation

LAYOUT CONSIDERATIONS

The output current transient time in the TLC59281 is very fast. In addition, all outputs turn on or off at the same time to minimize the output on-time error. This high current demand can cause GND to shift in the entire system, and lead to false triggering of signals. To overcome this issue, design all GND lines to be as wide and short as possible in order to reduce parasitic inductance and resistance.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
F. Falls within JEDEC MO–220.

THERMAL PAD MECHANICAL DATA

RGE (S–PVQFN–N24) PLASTIC QUAD FLATPACK NO–LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

C. Publication IPC–7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat–Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
