IRS21962S

Description

The IRS21962 is a high voltage, high speed power MOSFET and IGBT driver with propagation delay matched output channels. Proprietary HVIC and latch immune CMOS technologies enable ruggedized monolithic construction. The floating logic input is compatible with standard 5 V CMOS or LSTTL logic and can be operated up to 600 volts above the COM ground. The output driver feature a 500 mA high pulse current buffer stage designed for minimum driver cross-conduction. The floating channel can be used to drive an N-channel power MOSFET or IGBT in the high side configuration, which operates up to 600 V above COM ground.
