SBOS456H – SEPTEMBER 2008 – REVISED FEBRUARY 2015

REF50xxA-Q1 Low-Noise, Very Low Drift, Precision Voltage Reference

1 Features

- Qualified for Automotive Applications
- Low Temperature Drift
  - Standard Grade: 8 ppm/°C (max)
- High Accuracy
  - Standard Grade: 0.1% (max)
- Low Noise: 3 μV_{PP}/V
- Excellent Long-Term Stability:
  - 5 ppm/1000 hr (typ) after 1000 hours
- High Output Current: ±10 mA
- Temperature Range: –40°C to 125°C

2 Applications

- 16-Bit Data Acquisition Systems
- ATE Equipment
- Industrial Process Control
- Medical Instrumentation
- Optical Control Systems
- Precision Instrumentation

3 Description

The REF50xxA-Q1 family of devices is low-noise, low-drift, very-high precision-voltage reference. These reference devices are capable of both sinking and sourcing, and are very robust with regard to line and load changes.

Excellent temperature drift (3 ppm/°C) and high accuracy (0.05%) are achieved using proprietary design techniques. These features combined with very low noise make the REF50xxA-Q1 family of devices ideal for use in high-precision data acquisition systems.

Each reference voltage is available in a standard-grade versions. The devices are offered in SO-8 packages and are specified from –40°C to 125°C.

Device Information(1)

PART NUMBER	PACKAGE	OUTPUT VOLTAGE
REF5020A-Q1		2.048 V
REF5025A-Q1		2.5 V
REF5030A-Q1	SOIC (8)	3 V
REF5040A-Q1		4.096 V
REF5045A-Q1		4.5 V
REF5050A-Q1		5 V

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Table of Contents

5   Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision G (October 2013) to Revision H   **Page**

- Added the *Pin Configuration and Functions* section, *Recommended Operating Conditions* table, *Thermal Information* table, *Feature Description* section, *Device Functional Modes* section, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section 1
- Added *A-Q1* to the end of the device numbers 1
- Changed the MIN and MAX values for the REF5040 initial accuracy parameter in the *Electrical Characteristics* table 5

Changes from Revision F (September 2011) to Revision G   **Page**

- Deleted reference to *high grade* throughout the document 1
- Deleted *Package/Ordering Information* table from datasheet 4
- Deleted references to the MSOP-8 package and *High-Grade* from the *THERMAL HYSTERESIS* section of the *ELECTRICAL CHARACTERISTICS: ALL DEVICES* table 6
- Deleted references to the MSOP-8 package from the *LONG-TERM STABILITY* section of the *ELECTRICAL CHARACTERISTICS: ALL DEVICES* table 6
- Deleted graphs for MSOP-8 package from *TYPICAL CHARACTERISTICS* section 9

Changes from Revision E (August 2011) to Revision F   **Page**

- Added REF5045AQDRQ1 HBM ESD rating of 1000 V 4

8 Detailed Description

8.1 Overview

The REF50xxA-Q1 family of devices is a low-noise, precision-bandgap voltage reference that is specifically designed for excellent initial voltage accuracy and drift. See the *Functional Block Diagram* section for a simplified block diagram of the REF50xxA-Q1 family of devices.

8.2 Functional Block Diagram
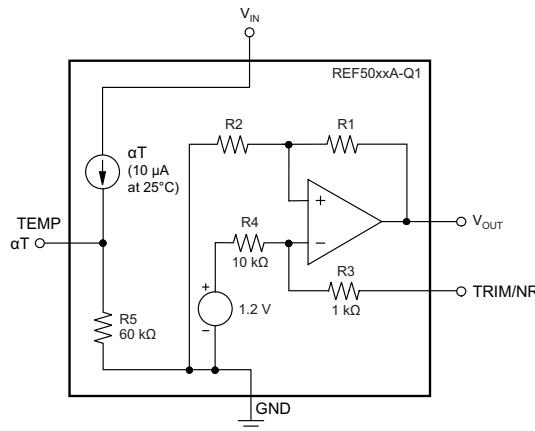

8.3 Feature Description

8.3.1 Supply Voltage

The REF50xxA-Q1 family of voltage references features extremely low dropout voltage. With the exception of the REF5020A-Q1 device, which has a minimum supply requirement of 2.7 V, these references can operate with a supply of 200 mV above the output voltage in an unloaded condition. For loaded conditions, Figure 6 in the *Typical Characteristics* section shows a typical dropout voltage versus load plot.

8.3.2 Using the TRIM/NR Pin

The REF50xxA-Q1 family of devices provides a very accurate voltage output. However, V_{OUT} can be adjusted to reduce noise and shift the output voltage from the nominal value by configuring the trim and noise reduction pin (TRIM/NR, pin 5). The TRIM/NR pin provides a ±15-mV adjustment of the device bandgap, which produces a ±15-mV change on the V_{OUT} pin. Figure 25 shows a typical circuit using the TRIM/NR pin to adjust V_{OUT}. When using this technique, the temperature coefficients of the resistors can degrade the temperature drift at the output.
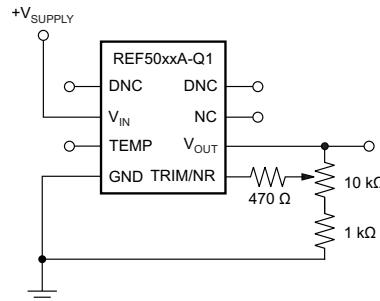

Figure 25. V_{OUT} Adjustment Using TRIM/NR Pin

TEXAS INSTRUMENTS

www.ti.com

Feature Description (continued)

The REF50xxA-Q1 family of devices allows access to the bandgap through the TRIM/NR pin. Placing a capacitor from the TRIM/NR pin to GND (as shown in Figure 26) in combination with the internal 1-kΩ resistor creates a low-pass filter that lowers the overall noise measured on the V_{OUT} pin. A capacitance of 1 µF is suggested for a low-pass filter with a corner frequency of 14.5 Hz. Higher capacitance results in a lower cutoff frequency.
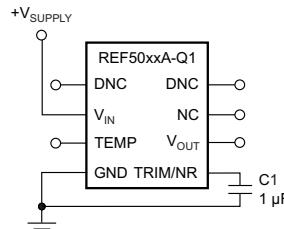

Figure 26. Noise Reduction Using TRIM/NR Pin

8.3.3 Temperature Drift

The REF50xxA-Q1 family of devices is designed for minimal drift error, which is defined as the change in output voltage over temperature. The drift is calculated using the box method. Use Equation 1 to calculate the drift.

$$\text{Drift} = \left(\frac{V_{OUTMAX} - V_{OUTMIN}}{V_{OUT} \times \text{Temp Range}} \right) \times 10^6 (\text{ppm})$$

(1)

The REF50xxA-Q1 family of devices features a maximum drift coefficient of 8 ppm/°C for the standard-grade.

8.3.4 Temperature Monitoring

The temperature output pin (TEMP, pin 3) provides a temperature-dependent voltage output with approximately 60-kΩ source impedance. As shown in Figure 8, the output voltage follows the nominal relationship:

$$V_{TEMP\ PIN} = 509\ \text{mV} + 2.64 \times T(°C)$$

(2)

This pin indicates general chip temperature, accurate to approximately ±15°C. Although this pin is not generally suitable for accurate temperature measurements, it can be used to indicate temperature changes or for temperature compensation of analog circuitry. A temperature change of 30°C corresponds to an approximate 79-mV change in voltage at the TEMP pin.

The TEMP pin has high output impedance (see the *Functional Block Diagram* section). Loading this pin with a low-impedance circuit induces a measurement error; however, it does not have any effect on V_{OUT} accuracy.

To avoid errors caused by low-impedance loading, buffer the TEMP pin output with a suitable low-temperature drift op amp, such as the OPA333, OPA335, or OPA376, as shown in Figure 27.
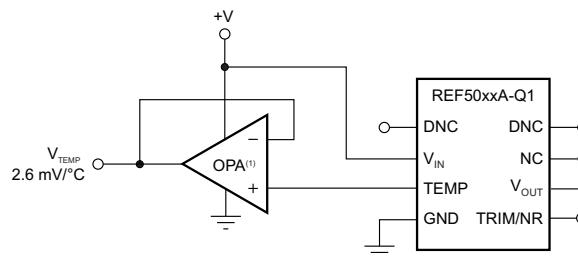

(1) Low drift op amp, such as the OPA333, OPA335, or OPA376 device.

Figure 27. Buffering the TEMP Pin Output

8.4 Device Functional Modes

The REF50xxA-Q1 family of devices can only operate in an on or off mode. As long as a sufficient input supply voltage is made available to device, the device performs in standard operation. The device cannot be placed in a low power or shutdown mode.

9   Application and Implementation

> **NOTE**
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1   Application Information

9.1.1   Thermal Hysteresis

Thermal hysteresis for the REF50xxA-Q1 family of devices is defined as the change in output voltage after operating the device at 25°C, cycling the device through the specified temperature range, and returning to 25°C. Use Equation 3 to calculate the thermal hysteresis.

$$V_{HYST} = \left(\frac{|V_{PRE} - V_{POST}|}{V_{NOM}} \right) \cdot 10^6 \text{ (ppm)}$$

where

- V_{HYST} = thermal hysteresis (in units of ppm)
- V_{NOM} = the specified output voltage
- V_{PRE} = output voltage measured at 25°C pretemperature cycling
- V_{POST} = output voltage measured after the device has been cycled from 25°C through the specified temperature range of −40°C to +125°C and returned to 25°C   (3)

9.2   Typical Applications

9.2.1   Standalone Applications

Figure 28 shows the typical connections for the REF50xxA-Q1 family of devices.
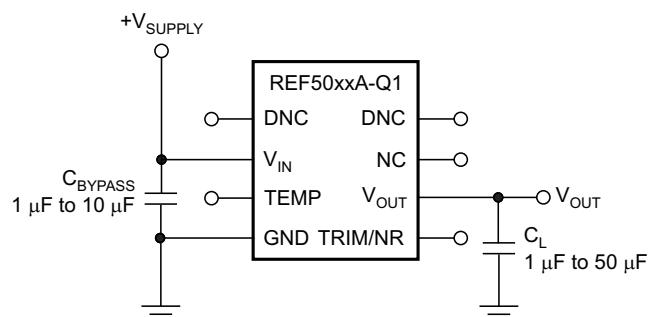

Figure 28. Basic Connections

Typical Applications (continued)

9.2.1.1 Design Requirements

A supply bypass capacitor with a value between 1 µF to 10 µF is recommended. A 1-µF to 50-µF, low-ESR output capacitor (C_L) must be connected from V_{OUT} to GND. The ESR value should be less than or equal to 1.5 Ω. The ESR minimizes gain peaking of the internal 1.2-V reference and thus reduces noise at the V_{OUT} pin.

9.2.1.2 Detailed Design Procedure

9.2.1.2.1 Power Dissipation

The REF50xxA-Q1 family of devices is specified to deliver current loads of ±10 mA over the specified input voltage range. The temperature of the device increases according Equation 4.

$$T_J = T_A + P_D \times R_{\theta JA}$$

where

- T_J = Junction temperature (°C)
- T_A = Ambient temperature (°C)
- P_D = Power dissipated (W)
- $R_{\theta JA}$ = Junction-to-ambient thermal resistance (°C/W)   (4)

The junction temperature of the REF50xxA-Q1 family of devices must not exceed the absolute maximum rating of 150°C.

9.2.1.2.2 Noise Performance

The *Electrical Characteristics: Per Device* section specifies the typical voltage noise at 0.1 Hz to 10 Hz for each member of the REF50xxA-Q1 family of devices. The noise voltage increases with output voltage and operating temperature. Additional filtering can be used to improve output noise levels, although care should be taken to ensure the output impedance does not degrade performance.

For additional information about how to minimize noise and maximize performance in mixed-signal applications, such as data converters, refer to the series of *Analog Applications Journal* articles entitled, *How a Voltage Reference Affects ADC Performance*. See the *Related Documentation* section for a list of these articles.

SBOS456H –SEPTEMBER 2008–REVISED FEBRUARY 2015

Typical Applications (continued)

9.2.2 Negative-Reference Voltage Applications

For applications requiring a negative and positive reference voltage, the REF50xxA-Q1 family of devices and the OPA735 device can be used to provide a dual-supply reference from a 5-V supply. Figure 31 shows the REF5025A-Q1 used to provide a 2.5-V supply reference voltage. The low drift performance of the REF50xxA-Q1 family of devices complements the low offset voltage and zero drift of the OPA735 device to provide an accurate solution for split-supply applications. Care must be taken to match the temperature coefficients of R_1 and R_2.
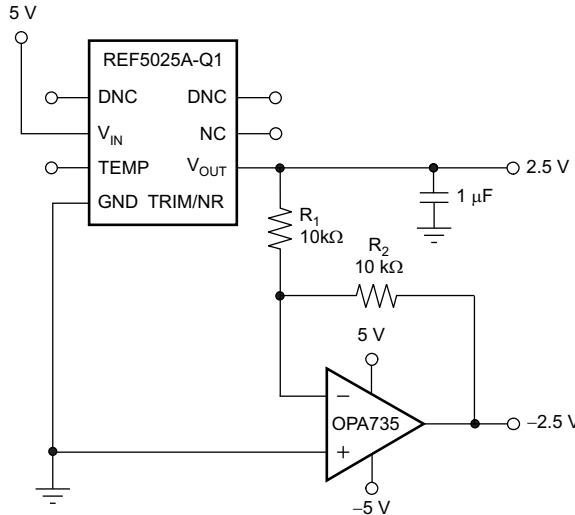

NOTE: Bypass capacitors not shown.

Figure 31. The REF5025A-Q1 and OPA735 Create Positive and Negative Reference Voltages

9.2.3 Data-Acquisition Applications

Data acquisition systems often require stable voltage references to maintain accuracy. The REF50xxA-Q1 family of devices features low noise, very low drift, and high initial accuracy for high-performance data converters. Figure 32 shows the REF5040A-Q1 in a basic data acquisition system.
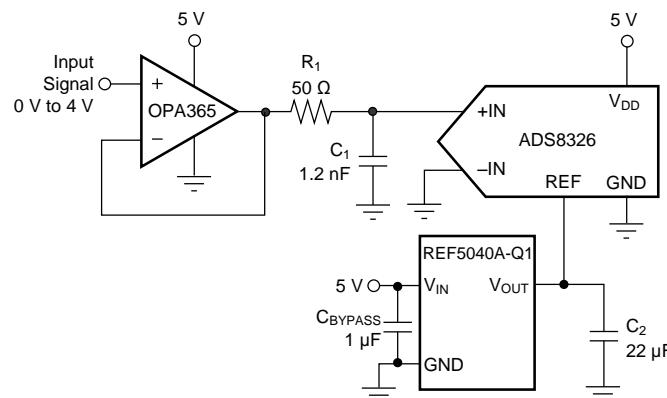

Figure 32. Basic Data Acquisition System

10 Power Supply Recommendations

The REF50xxA-Q1 family of voltage references features extremely low dropout voltage. With the exception of the REF5020A-Q1 device, which has a minimum supply requirement of 2.7 V, these references can operate with a supply of 200 mV above the output voltage in an unloaded condition. A supply bypass capacitor with a value ranging between 0.1 µF and 10 µF is recommended.

11 Layout

11.1 Layout Guidelines

Refer to Figure 33 and use the following guidelines for proper layout design:

- Connect low-ESR, 0.1-µF ceramic bypass capacitors at the V_{IN} and V_{OUT} pins.
- Decouple other active devices in the system per the device specifications.
- Use a solid ground plane to help distribute heat and reduce electromagnetic-interference (EMI) noise pickup.
- Place the external components as close to the device as possible. This configuration prevents parasitic errors (such as the Seebeck effect) from occurring.
- Minimize trace length between the reference and bias connections to the end device to reduce noise pickup.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible and only make perpendicular crossings when absolutely necessary.

11.2 Layout Example

12.3 Trademarks

All trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

www.ti.com

22-Dec-2015

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
