TPS61087-Q1

TPS61087-Q1 650-kHz or 1.2-MHz, 18.5-V Step-Up DC-DC Converter With 3.2-A Switch

1 Features

- Qualified for Automotive Applications
- 2.5-V to 6-V Input Voltage Range
- 18.5-V Boost Converter With 3.2-A Switch Current
- 650-kHz or 1.2-MHz Selectable Switching Frequency
- Adjustable Soft Start
- Thermal Shutdown
- Undervoltage Lockout
- 10-Pin VQFN Package with Wettable Flanks

2 Applications

- Automotive Infotainment Clusters
  - Instrument Clusters, Head Units
  - Radio, Navigation
  - Audio Amplifiers
- Automotive Body Electronics
  - Body Control Modules
  - Gateway
- Telemetrics and eCall
- Advanced Driver Assistance System (ADAS)

3 Description

The TPS61087-Q1 is a high-frequency, high-efficiency DC-to-DC converter with an integrated 3.2-A, 0.13-Ω power switch capable of providing an output voltage up to 18.5 V. The selectable frequency of 650 kHz or 1.2 MHz allows the use of small external inductors and capacitors, and provides fast transient response. The external compensation allows optimizing the application for specific conditions. A capacitor connected to the soft-start pin minimizes inrush current at start-up.

7 Detailed Description

7.1 Overview

The TPS61087-Q1 boost converter is designed for output voltages up to 18.5 V with a switch peak current limit of 3.2-A minimum. The device, which operates in a current mode scheme with quasi-constant frequency, is externally compensated for maximum flexibility and stability. The switching frequency is selectable from 650 kHz to 1.2 MHz and the minimum input voltage is 2.5 V. To limit the inrush current at start-up a soft-start pin is available.

TPS61087-Q1 boost converter's novel topology using adaptive OFF-time provides superior load and line transient responses and operates also over a wider range of applications than conventional converters.

The selectable switching frequency offers the possibility to optimize the design either for the use of small sized components (1.2 MHz) or for higher system efficiency (650 kHz). However, the frequency changes slightly because the voltage drop across the $r_{DS(on)}$ has some influence on the current and voltage measurement and thus on the ON-time (the OFF-time remains constant).

Depending on the load current, the converter operates in continuous conduction mode (CCM), discontinuous conduction mode (DCM), or pulse skip mode to maintain the output voltage.

SLVSB50B –DECEMBER 2011–REVISED JUNE 2016

7.3 Feature Description

7.3.1 Soft Start

The boost converter has an adjustable soft start to prevent high inrush current during start-up. To minimize the inrush current during start-up an external capacitor, connected to the SS pin and charged with a constant current, is used to slowly ramp up the internal current limit of the boost converter. When the EN pin is pulled high, the soft-start capacitor (C_{SS}) is immediately charged to 0.3 V. The capacitor is then charged at a constant current of 10 µA typically until the output of the boost converter V_S has reached its Power Good threshold (roughly 98% of V_S nominal value). During this time, the SS voltage directly controls the peak inductor current, starting with 0 A at V_{SS} = 0.3 V up to the full current limit at V_{SS} = 800 mV. The maximum load current is available after the soft start is completed. As the size of the capacitor increases the ramp of the current limit slows and the soft-start time increases. A 100-nF capacitor is usually sufficient for most of the applications. When the EN pin is pulled low, the soft-start capacitor is discharged to ground.

7.3.2 Frequency Select Pin (FREQ)

The switching frequency of the device is set using the frequency select pin (FREQ) to 650 kHz (FREQ = low) or 1.2 MHz (FREQ = high). Higher switching frequency improves load transient response but slightly reduces the efficiency. Another benefit of higher switching frequency is a lower output ripple voltage. Unless light load efficiency is a major concern, TI recommends using a 1.2-MHz switching frequency.

7.3.3 Undervoltage Lockout (UVLO)

To avoid misoperation of the device at low input voltages, an undervoltage lockout is included, which disables the device if the input voltage falls below 2.4 V.

7.3.4 Thermal Shutdown

A thermal shutdown is implemented to prevent damages due to excessive heat and power dissipation. Typically the thermal shutdown happens at a junction temperature of 150°C. When the thermal shutdown is triggered, the device stops switching until the junction temperature falls below typically 136°C. Then the device starts switching again.

7.3.5 Overvoltage Prevention

If overvoltage is detected on the FB pin (typically 3% above the nominal value of 1.238 V) the part stops switching immediately until the voltage on this pin drops to its nominal value. This prevents overvoltage on the output and secures the circuits connected to the output from excessive overvoltage.

7.4 Device Functional Modes

The converter operates in continuous conduction mode (CCM) as soon as the input current increases above half the ripple current in the inductor; for lower load currents, the converter switches into discontinuous conduction mode (DCM). If the load is further reduced, the part starts to skip pulses to maintain the output voltage.

8 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPS61087-Q1 is designed for output voltages up to 18.5 V with a switch peak current limit of 3.2-A minimum. The device, which operates in a current mode scheme with quasi-constant frequency, is externally compensated for maximum flexibility and stability. The switching frequency is selectable from 650 kHz to 1.2 MHz, and the input voltage range is from 2.3 V to 6 V. To control the inrush current at start-up a soft-start pin is available. The following section provides a step-by-step design approach for configuring the TPS61087-Q1 as a voltage regulating boost converter.

8.2 Typical Applications

### 8.2.1 Typical Application Circuit: 5 V to 15 V (f_S = 1.2 MHz)

Figure 8. 5 V to 15 V (f_S = 1.2 MHz) Application Diagram

8.2.1.1 Design Requirements

For this design example, use the parameters shown in Table 2.

Table 2. Design Parameters

PARAMETER	EXAMPLE VALUE
Input voltage	5 V ± 20%
Output voltage	15 V
Output current	900 mA
Switching frequency	1.2 MHz

TPS61087-Q1

SLVSB50B – DECEMBER 2011 – REVISED JUNE 2016

www.ti.com

8.2.1.2 Detailed Design Procedure

The first step in the design procedure is to verify that the maximum possible output current of the boost converter supports the specific application requirements. A simple approach is to estimate the converter efficiency, by taking the efficiency numbers from the provided efficiency curves or to use a worst case assumption for the expected efficiency (for example: 90%).

Duty cycle (D) is calculated with Equation 1.

$$D = 1 - \frac{V_{IN} \cdot \eta}{V_S} \tag{1}$$

Maximum output current ($I_{out(max)}$) is calculated with Equation 2.

$$I_{out(max)} = \left(I_{LIM(min)} - \frac{\Delta I_L}{2} \right) \cdot (1 - D) \tag{2}$$

Peak switch current in application (I_{swpeak}) is calculated with Equation 3.

$$I_{swpeak} = \frac{\Delta I_L}{2} + \frac{I_{out}}{1 - D} \tag{3}$$

The inductor peak-to-peak ripple current (ΔI_L) is calculated with Equation 4.

$$\Delta I_L = \frac{V_{IN} \cdot D}{f_S \cdot L} \tag{4}$$

where

- V_{IN} is the minimum input voltage.
- V_S is the output voltage.
- $I_{LIM(min)}$ is the converter switch current limit (minimum switch current limit = 3.2 A).
- f_S is the converter switching frequency (typically 1.2 MHz or 650 kHz).
- L is the selected inductor value.
- η is the estimated converter efficiency (use the number from the efficiency plots or 90% as an estimation).

The peak switch current is the steady state peak switch current that the integrated switch, inductor, and external Schottky diode must be able to handle. The calculation must be done for the minimum input voltage where the peak switch current is the highest.

8.2.1.2.1 Inductor Selection

The TPS61087-Q1 is designed to work with a wide range of inductors. The main parameter for the inductor selection is the saturation current of the inductor which must be higher than the peak switch current as calculated in Equation 3 with additional margin to cover for heavy load transients. A more conservative alternative is to choose an inductor with a saturation current at least as high as the maximum switch current limit of 4.8 A. The other important parameter is the inductor DC resistance. As the DC resistance decreases, the efficiency usually increases. It is important to note that the inductor DC resistance is not the only parameter determining the efficiency. Especially for a boost converter where the inductor is the energy storage element, the type and core material of the inductor influences the efficiency as well. At high switching frequencies of 1.2 MHz inductor core losses, proximity effects, and skin effects become more important. An inductor with a larger form factor usually gives higher efficiency. The efficiency difference between different inductors can vary from 2% to 10%. For the TPS61087-Q1, inductor values from 3 µH to 6 µH are a good choice with a switching frequency of 1.2 MHz, typically 3.3 µH. At 650 kHz, TI recommends inductors from 6 µH to 13 µH, typically 6.8 µH. See Table 3 for inductor selection. Customers must verify and validate selected components for suitability with their application.

TEXAS INSTRUMENTS

TPS61087-Q1

www.ti.com   SLVSB50B –DECEMBER 2011–REVISED JUNE 2016

TI recommends that the inductor current ripple is below 35% of the average inductor current. Equation 5 can be used to calculate the inductor value (L).

$$L = \left(\frac{V_{IN}}{V_S}\right)^2 \cdot \left(\frac{V_S - V_{IN}}{I_{out} \cdot f_S}\right) \cdot \left(\frac{\eta}{0.35}\right)$$

where

- I_{out} is the maximum output current in the application. (5)

Table 3. Inductor Selection

INDUCTOR VALUE	TYPICAL DCR	I_{sat}	SUPPLIER	SIZE (L × W × H mm)	COMPONENT CODE
1.2 MHz

10 µH	80 mΩ	3.5 A	Coilcraft	12.95 × 9.4 × 5.08	DS3316P
10 µH	29 mΩ	4 A	Sumida	8.3 × 8.3 × 4.5	CDRH8D43
6.8 µH	55 mΩ	4.1 A	Wurth Elektronik	12.7 × 10 × 4.9	74454068

8.2.1.2.2 Rectifier Diode Selection

To achieve high efficiency a Schottky type must be used for the rectifier diode. The reverse voltage rating must be higher than the maximum output voltage of the converter. The averaged rectified forward current (I_{avg}), the Schottky diode must be rated for, is equal to the output current (I_{out}).

$$I_{avg} = I_{out}$$

(6)

Usually a Schottky diode with 2-A maximum average rectified forward current rating is sufficient for most applications. The Schottky rectifier can be selected with lower forward current capability depending on the output current but must be able to dissipate the power. The dissipated power (P_D) is the average rectified forward current times the diode forward voltage ($V_{forward}$).

$$P_D = I_{avg} \cdot V_{forward}$$

(7)

Typically the diode must be able to dissipate around 500 mW depending on the load current and forward voltage. See Table 4 for diode selection. Customers must verify and validate selected components for suitability with their application.

Table 4. Rectifier Diode Selection

I_{avg}	V_R	$V_{forward}$	SUPPLIER	COMPONENT CODE
2 A	20 V	0.44 V	Vishay Semiconductor	SL22
2 A	20 V	0.5 V	Fairchild Semiconductor	SS22

TEXAS INSTRUMENTS

TPS61087-Q1

SLVSB50B – DECEMBER 2011 – REVISED JUNE 2016

www.ti.com

8.2.1.2.3 Setting the Output Voltage

The output voltage is set by an external resistor divider. Typically, a minimum current of 50 µA flowing through the feedback divider gives good accuracy and noise covering. A standard low side resistor of 18 kΩ is typically selected. The resistors are then calculated as shown in Equation 8:

$$R2 = \frac{V_{FB}}{70\mu A} \approx 18k\Omega \qquad R1 = R2 \cdot \left(\frac{V_S}{V_{FB}} - 1 \right)$$

$$V_{FB} = 1.238V$$
(8)

8.2.1.2.4 Compensation (COMP)

The regulator loop can be compensated by adjusting the external components connected to the COMP pin. The COMP pin is the output of the internal transconductance error amplifier.

Equation 9 can be used to calculate R_{COMP} and C_{COMP}.

$$R_{COMP} = \frac{110 \cdot V_{IN} \cdot V_S \cdot C_{out}}{L \cdot I_{out}} \qquad C_{COMP} = \frac{V_S \cdot C_{out}}{7.5 \cdot I_{out} \cdot R_{COMP}}$$

where

- C_{out} is the output capacitance.

(9)

Make sure that R_{COMP} < 120 kΩ and C_{COMP} > 820 pF, independent of the results of the above formulas.

See Table 5 for dedicated compensation networks giving an improved load transient response. These conservative R_{COMP} and C_{COMP} values for certain inductors, input, and output voltages provide a very stable system. For a faster response time, a higher R_{COMP} value can be used to enlarge the bandwidth, as well as a slightly lower value of C_{COMP} to keep enough phase margin. These adjustments must be performed in parallel with the load transient response monitoring of TPS61087-Q1.

Standard values of R_{COMP} = 16 kΩ and C_{COMP} = 2.7 nF works for the majority of the applications.

Table 5. Recommended Compensation Network Values at High and Low Frequency

FREQUENCY	L	V_S	V_IN ± 20%	R_COMP	C_COMP
High (1.2 MHz)	3.3 µH	15 V	5 V	100 kΩ	820 pF
			3.3 V	91 kΩ	1.2 nF
		12 V	5 V	68 kΩ	820 pF
			3.3 V	68 kΩ	1.2 nF
		9 V	5 V	39 kΩ	820 pF
			3.3 V	39 kΩ	1.2 nF
Low (650 kHz)	6.8 µH	15 V	5 V	51 kΩ	1.5 nF
			3.3 V	47 kΩ	2.7 nF
		12 V	5 V	33 kΩ	1.5 nF
			3.3 V	33 kΩ	2.7 nF
		9 V	5 V	18 kΩ	1.5 nF
			3.3 V	18 kΩ	2.7 nF

8.2.1.2.5 Input Capacitor Selection

TI recommends low ESR ceramic capacitors for good input voltage filtering. TPS61087-Q1 has an analog input (IN). Therefore, TI recommends placing a 1-µF bypass capacitor as close as possible to the IC from IN to GND.

Two 10-µF (or one 22-µF) ceramic input capacitors are sufficient for most of the applications. For better input voltage filtering this value can be increased. See Table 6 for output capacitor selection. Customers must verify and validate selected components for suitability with their application.

TEXAS INSTRUMENTS

TPS61087-Q1

www.ti.com   SLVSB50B –DECEMBER 2011–REVISED JUNE 2016

8.2.1.2.6 Output Capacitor Selection

TI recommends low ESR ceramic capacitors for best output voltage filtering. Four 10-µF (or two 22-µF) ceramic output capacitors work for most of the applications. Higher capacitor values can be used to improve the load transient response. See Table 6 for output capacitor selection. DC voltage derating factor must also be considered while choosing capacitors. Customers must verify and validate selected components for suitability with their application.

Table 6. Rectifier Input and Output Capacitor Selection

|	CAPACITOR (SIZE)	VOLTAGE RATING	SUPPLIER	COMPONENT CODE
C_{IN}	22 µF (1206)	16 V	Taiyo Yuden	EMK316 BJ 226ML
IN bypass	1 µF (0603)	16 V	Taiyo Yuden	EMK107 BJ 105KA
C_{OUT}	10 µF (1206)	25 V	Taiyo Yuden	TMK316 BJ 106KL

To calculate the output voltage ripple, use Equation 10.

$$\Delta V_C = \frac{V_S - V_{IN}}{V_S \cdot f_S} \cdot \frac{I_{out}}{C_{out}} \qquad \Delta V_{C\_ESR} = I_{L(peak)} \cdot R_{C\_ESR}$$

where

- ΔV_C is the output voltage ripple dependent on output capacitance, output current, and switching frequency.
- ΔV_{C_ESR} is the output voltage ripple due to output capacitors ESR (equivalent series resistance).
- I_{swpeak} is the inductor peak switch current in the application.
- R_{C_ESR} is the output capacitors equivalent series resistance (ESR). (10)

ΔV_{C_ESR} can be neglected in many cases because ceramic capacitors provide low ESR.

9   Power Supply Recommendations

The TPS61087-Q1 is designed to operate from an input voltage supply range from 2.3 V to 6 V. The power supply to the TPS61087-Q1 must have a current rating according to the supply voltage, output voltage, and output current of the TPS61087-Q1.

10   Layout

10.1   Layout Guidelines

For all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator could show stability problems as well as EMI problems.

Figure 23 provides an example of layout design with the TPS61087-Q1 device.
- Use wide and short traces for the main current path and for the power ground tracks.
- The input capacitor, output capacitor, and the inductor must be placed as close as possible to the IC.
- Use a common ground node for power ground and a different one for control ground to minimize the effects of ground noise. Connect these ground nodes at the GND terminal of the IC.
- The most critical current path for all boost converters is from the switching FET, through the rectifier diode, then the output capacitors, and back to ground of the switching FET. Therefore, the output capacitors and their traces must be placed on the same board layer as the IC and as close as possible between the SW pin and the GND terminal of the IC.

11 Device and Documentation Support

11.1 Device Support

11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

11.2 Documentation Support

11.2.1 Related Documentation

For related documentation see the following:
- *Performing Accurate PFM Mode Efficiency Measurements*
- *QFN/SON PCB Attachment*

11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.5 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.7 Glossary

SLYZ022 — *TI Glossary*.
This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGE OPTION ADDENDUM

www.ti.com   12-Jul-2016

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS61087QDRCRQ1	ACTIVE	VSON	DRC	10	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 125	PMOQ	Samples
TPS61087QWDRCRQ1	ACTIVE	VSON	DRC	10	3000	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 125	11ZC	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

THERMAL PAD MECHANICAL DATA
DRC (S−PVSON−N10)   PLASTIC SMALL OUTLINE NO−LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No−Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
