**TLV571**  
**2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT,**  
**PARALLEL ANALOG-TO-DIGITAL CONVERTER**  
SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

**features**

- **Fast Throughput Rate:** 1.25 MSPS at 5 V,  
625 KSPS at 3 V
- **Wide Analog Input:** 0 V to  $AV_{DD}$
- **Differential Nonlinearity Error:**  $< \pm 0.5$  LSB
- **Integral Nonlinearity Error:**  $< \pm 0.5$  LSB
- **Single 2.7-V to 5.5-V Supply Operation**
- **Low Power:** 12 mW at 3 V and 35 mW at 5 V
- **Auto Power Down of 1 mA Max**
- **Software Power Down:** 10  $\mu$ A Max
- **Internal OSC**
- **Hardware Configurable**
- **DSP and Microcontroller Compatible Parallel Interface**
- **Binary/Twos Complement Output**
- **Hardware Controlled Extended Sampling**
- **Hardware or Software Start of Conversion**

**applications**

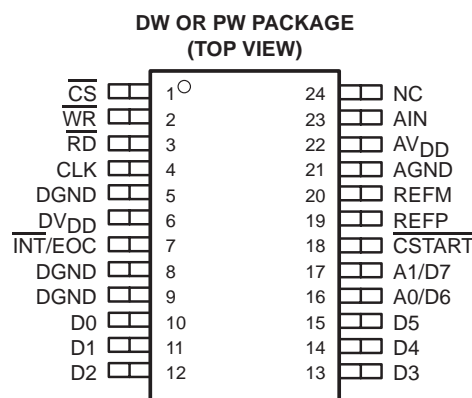

- **Mass Storage and HDD**
- **Automotive**
- **Digital Servos**
- **Process Control**
- **General-Purpose DSP**
- **Image Sensor Processing**

**description**

The TLV571 is an 8-bit data acquisition system that combines a high-speed 8-bit ADC and a parallel interface. The device contains two on-chip control registers allowing control of software conversion start and power down via the bidirectional parallel port. The control registers can be set to a default mode using a dummy  $\overline{RD}$  while  $\overline{WR}$  is tied low allowing the registers to be hardware configurable.

The TLV571 operates from a single 2.7-V to 5.5-V power supply. It accepts an analog input range from 0 V to  $AV_{DD}$  and digitizes the input at a maximum 1.25 MSPS throughput rate at 5 V. The power dissipations are only 12 mW with a 3-V supply or 35 mW with a 5-V supply. The device features an auto power-down mode that automatically powers down to 1 mA 50 ns after conversion is performed. In software power-down mode, the ADC is further powered down to only 10  $\mu$ A.

Very high throughput rate, simple parallel interface, and low power consumption make the TLV571 an ideal choice for high-speed digital signal processing.

NC – No internal connection

## TLV571

### 2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT, PARALLEL ANALOG-TO-DIGITAL CONVERTER

SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

#### functional block diagram

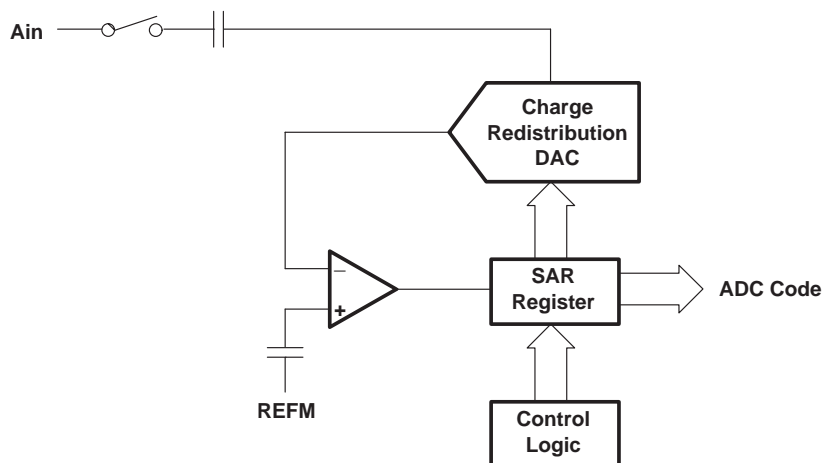

#### Terminal Functions

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
AGND	21		Analog ground
AIN	23	I	ADC analog input
AVDD	22		Analog supply voltage, 2.7 V to 5.5 V
A0/D6	16	I/O	Bidirectional 3-state data bus. D6/A0 along with D7/A1 is used as address lines to access CR0 and CR1 for initialization.
A1/D7	17	I/O	Bidirectional 3-state data bus. D7/A1 along with D6/A0 is used as address lines to access CR0 and CR1 for initialization.
CLK	4	I	External clock input
CS	1	I	Chip select. A logic low on CS enables the TLV571.
CSTART	18	I	Hardware sample and conversion start input. The falling edge of CSTART starts sampling and the rising edge of CSTART starts conversion.
DGND	5, 8, 9		Digital ground
DVDD	6		Digital supply voltage, 2.7 V to 5.5 V
D0 – D5	10–15	I/O	Bidirectional 3-state data bus
INT/EOC	7	O	End-of-conversion/interrupt
NC	24		Not connected
RD	3	I	Read data. A falling edge on RD enables a read operation on the data bus when CS is low.
REFM	20	I	Lower reference voltage (nominally ground). REFM must be supplied or REFM pin must be grounded.
REFP	19	I	Upper reference voltage (nominally AVDD). The maximum input voltage range is determined by the difference between the voltage applied to REFP and REFM.
WR	2	I	Write data. A rising edge on the WR latches in configuration data when CS is low. When using software conversion start, a rising edge on WR also initiates an internal sampling start pulse. When WR is tied to ground, the ADC in nonprogrammable (hardware configuration mode).

## detailed description

### analog-to-digital SAR converter

**Figure 1**

The TLV571 is a successive-approximation ADC utilizing a charge redistribution DAC. Figure 1 shows a simplified version of the ADC.

The sampling capacitor acquires the signal on AIN during the sampling period. When the conversion process starts, the SAR control logic and charge redistribution DAC are used to add and subtract fixed amounts of charge from the sampling capacitor to bring the comparator into a balanced condition. When the comparator is balanced, the conversion is complete and the ADC output code is generated.

### sampling frequency, $f_s$

The TLV571 requires 16 CLKs for each conversion, therefore the equivalent maximum sampling frequency achievable with a given CLK frequency is:

$$f_{s(max)} = (1/16) f_{CLK}$$

The TLV571 is software configurable. The first two MSB bits, D(7,6) are used to address which register to set. The remaining six bits are used as control data bits. There are two control registers, CR0 and CR1, that are user configurable. All of the register bits are written to the control register during write cycles. A description of the control registers is shown in Figure 2.

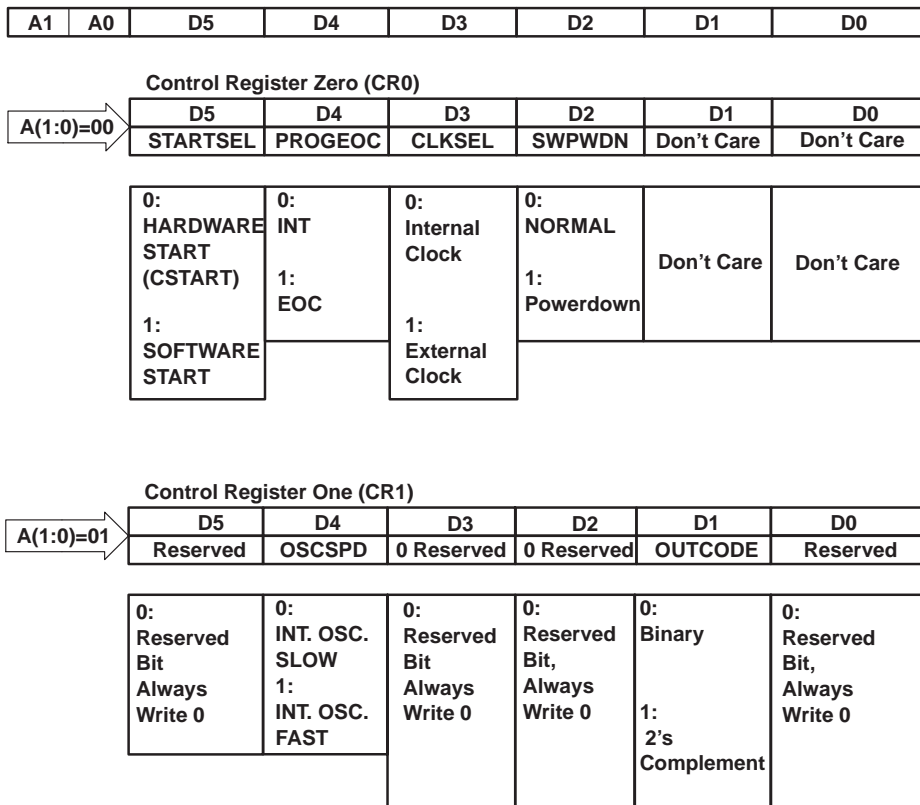

## TLV571

### 2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT, PARALLEL ANALOG-TO-DIGITAL CONVERTER

SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

#### detailed description (continued)

#### control registers

**Figure 2. Input Data Format**

#### hardware configuration option

The TLV571 can configure itself. This option is enabled when the  $\overline{WR}$  pin is tied to ground and a dummy  $\overline{RD}$  signal is applied. The ADC is now fully configured. Zeros or default values are applied to both control registers. The ADC is configured ideally for 3-V operation, which means the internal OSC is set at 10 MHz and hardware start of conversion using  $\overline{CSTART}$ .

#### ADC conversion modes

The TLV571 provides two start of conversion modes. Table 1 explains these modes in more detail.

**TLV571**  
**2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT,**  
**PARALLEL ANALOG-TO-DIGITAL CONVERTER**  
 SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

**detailed description (continued)**

**Table 1. Conversion Modes**

START OF CONVERSION	OPERATION	COMMENTS – FOR INPUT
Hardware start (CSTART) CR0.D5 = 0	<ul style="list-style-type: none"> <li>Repeated conversions from AIN</li> <li>CSTART falling edge to start sampling</li> <li>CSTART rising edge to start conversion</li> <li>If in INT mode, one INT pulse generated after each conversion</li> <li>If in EOC mode, EOC will go high to low at start of conversion, and return high at end of conversion.</li> </ul>	CSTART rising edge must be applied a minimum of 5 ns before or after CLK rising edge.
Software start CR0.D5 = 1	<ul style="list-style-type: none"> <li>Repeated conversions from AIN</li> <li>WR rising edge to start sampling initially. Thereafter, sampling occurs at the rising edge of RD.</li> <li>Conversion begins after 6 clocks after sampling has begun. Thereafter, if in INT mode, one INT pulse generated after each conversion</li> <li>If in EOC mode, EOC will go high to low at start of conversion and return high at end of conversion.</li> </ul>	With external clock, WR and RD rising edge must be a minimum 5 ns before or after CLK rising edge.

**configure the device**

The device can be configured by writing to control registers CR0 and CR1.

**Table 2. TLV571 Programming Examples**

REGISTER	INDEX		D5	D4	D3	D2	D1	D0	COMMENT
	D7	D6							
<b>EXAMPLE1</b>									
CR0	0	0	0	0	0	0	0	0	Normal, INT OSC
CR1	0	1	0	0	0	0	0	0	Binary
<b>EXAMPLE2</b>									
CR0	0	0	0	1	1	1	0	0	Power down, EXT OSC
CR1	0	1	0	0	0	0	1	0	2's complement output

**power down**

The TLV571 offers two power down modes, auto power down and software power down. This device will automatically proceed to auto power down mode if RD is not present one clock after conversion. Software power down is controlled directly by the user by pulling CS to DVDD.

**Table 3. Power Down Modes**

PARAMETERS/MODES	AUTO POWER DOWN	SOFTWARE POWER DOWN (CS = DVDD)
Maximum power down dissipation current	1 mA	10 µA
Comparator	Power down	Power down
Clock buffer	Power down	Power down
Control registers	Saved	Saved
Minimum power down time	1 CLK	2 CLK
Minimum resume time	1 CLK	2 CLK

## TLV571

### 2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT, PARALLEL ANALOG-TO-DIGITAL CONVERTER

SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

#### detailed description (continued)

##### reference voltage input

The TLV571 has two reference input pins: REFP and REFM. The voltage levels applied to these pins establish the upper and lower limits of the analog inputs to produce a full-scale and zero-scale reading respectively. The values of REFP, REFM, and the analog input should not exceed the positive supply or be less than GND consistent with the specified absolute maximum ratings. The digital output is at full scale when the input signal is equal to or higher than REFP and is at zero when the input signal is equal to or lower than REFM.

##### sampling/conversion

All sampling, conversion, and data output in the device are started by a trigger. This could be the  $\overline{RD}$ ,  $\overline{WR}$ , or  $\overline{CSTART}$  signal depending on the mode of conversion and configuration. The rising edge of  $\overline{RD}$ ,  $\overline{WR}$ , and  $\overline{CSTART}$  signal are extremely important, since they are used to start the conversion. These edges need to stay close to the rising edge of the external clock (if it is used as CLK). The minimum setup and hold time with respect to the rising edge of the external clock should be 5 ns minimum. When the internal clock is used, this is not an issue since these two edges will start the internal clock automatically. Therefore, the setup time is always met. Software controlled sampling lasts 6 clock cycles. This is done via the CLK input or the internal oscillator if enabled. The input clock frequency can be 1 MHz to 20 MHz, translating into a sampling time from 0.6  $\mu$ s to 0.3  $\mu$ s. The internal oscillator frequency is 9 MHz minimum (oscillator frequency is between 9 MHz to 22 MHz), translating into a sampling time from 0.6  $\mu$ s to 0.3  $\mu$ s. Conversion begins immediately after sampling and lasts 10 clock cycles. This is again done using the external clock input (1 MHz–20 MHz) or the internal oscillator (9 MHz minimum) if enabled. Hardware controlled sampling, via  $\overline{CSTART}$ , begins on falling  $\overline{CSTART}$  lasts the length of the active  $\overline{CSTART}$  signal. This allows more control over the sampling time, which is useful when sampling sources with large output impedances. On rising  $\overline{CSTART}$ , conversion begins. Conversion in hardware controlled mode also lasts 10 clock cycles. This is done using the external clock input (1 MHz–20 MHz) or the internal oscillator (9 MHz minimum) as is the case in software controlled mode.

NOTE:  $t_{su}$  = setup time,  $t_h$  = hold time

**Figure 3. Trigger Timing – Software Start Mode Using External Clock**

TLV571

**2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT,  
PARALLEL ANALOG-TO-DIGITAL CONVERTER**

SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

---

### start of conversion mechanism

There are two ways to convert data: hardware and software. In the hardware conversion mode the ADC begins sampling at the falling edge of  $\overline{\text{CSTART}}$  and begins conversion at the rising edge of  $\overline{\text{CSTART}}$ . Software start mode ADC samples for 6 clocks, then conversion occurs for ten clocks. The total sampling and conversion process lasts only 16 clocks in this case. If  $\overline{\text{RD}}$  is not detected during the next clock cycle, the ADC automatically proceeds to a power-down state. Data is valid on the rising edge of  $\overline{\text{INT}}$  in both conversion modes.

### hardware CSTART conversion

#### *external clock*

With  $\overline{\text{CS}}$  low and  $\overline{\text{WR}}$  low, data is written into the ADC. The sampling begins at the falling edge of  $\overline{\text{CSTART}}$  and conversion begins at the rising edge of  $\overline{\text{CSTART}}$ . At the end of conversion, EOC goes from low to high, telling the host that conversion is ready to be read out. The external clock is active and is used as the reference at all times. With this mode, it is required that  $\overline{\text{CSTART}}$  is not applied at the rising edge of the clock (see Figure 4).

**TEXAS  
INSTRUMENTS**

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

start of conversion mechanism (continued)

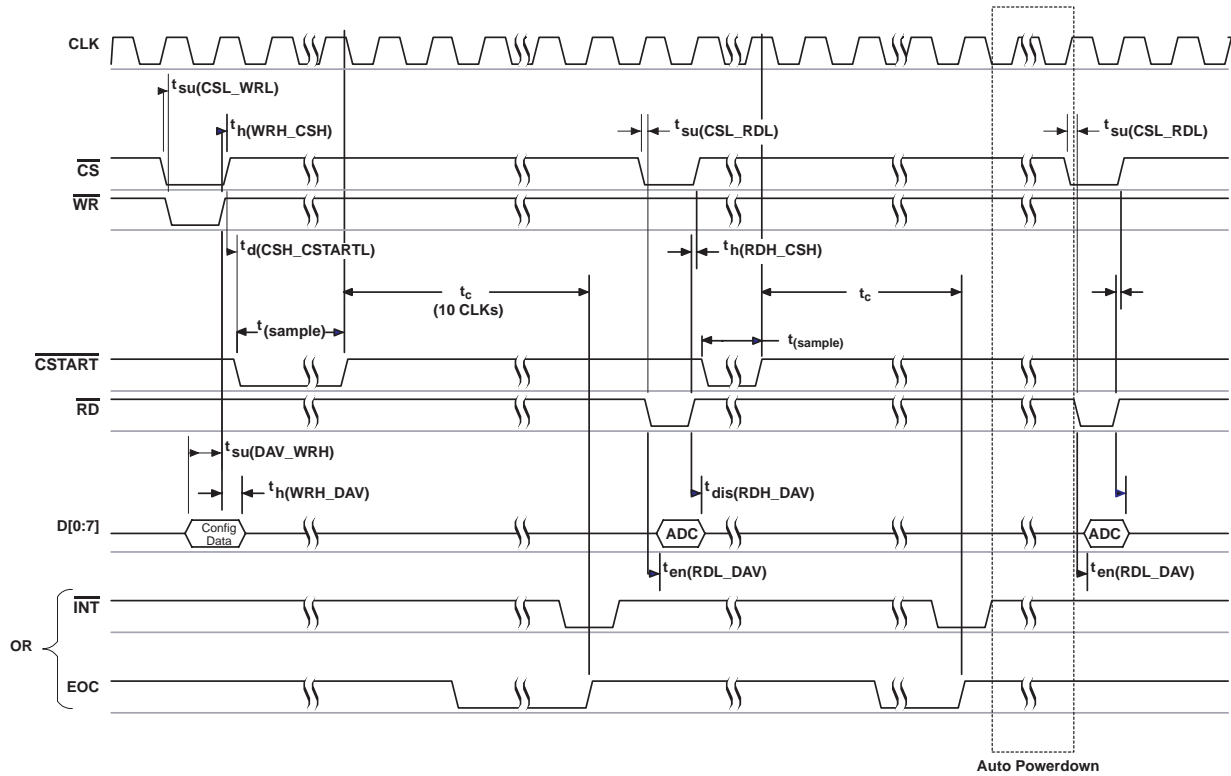

Figure 4. Input Conversion – Hardware  $\overline{\text{CSTART}}$ , External Clock

# internal clock

With  $\overline{CS}$  low and  $\overline{WR}$  low, data is written into the ADC. The sampling begins at the falling edge of  $\overline{CSTART}$ , and conversion begins at the rising edge of  $\overline{CSTART}$ . The internal clock turns on at the rising edge of  $\overline{CSTART}$ . The internal clock is disabled after each conversion.

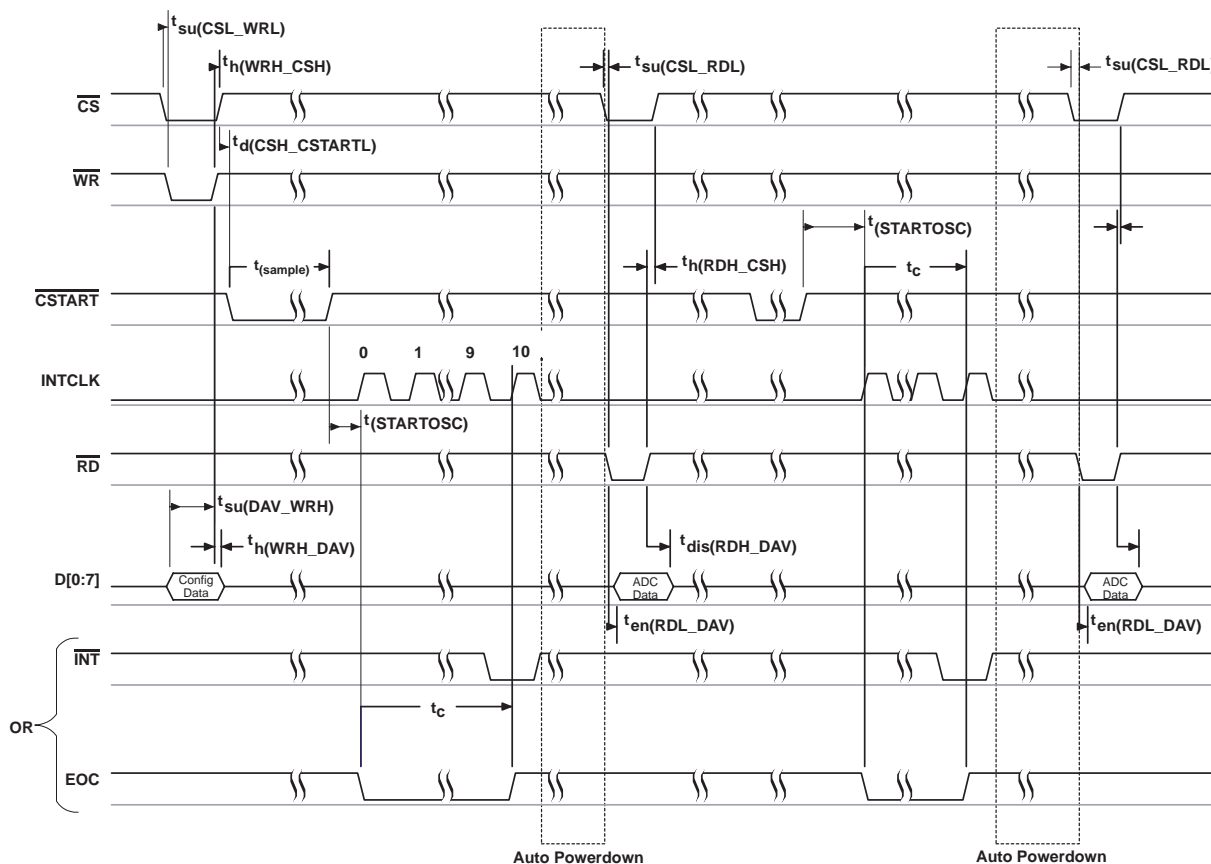

Figure 5. Input Conversion – Hardware  $\overline{CSTART}$ , Internal Clock

## software START conversion

### external clock

With  $\overline{CS}$  low and  $\overline{WR}$  low, data is written into the ADC. Sampling begins at the rising edge of  $\overline{WR}$ . The conversion process begins 6 clocks after sampling begins. At the end of conversion, the  $\overline{INT}$  goes low telling the host that conversion is ready to be read out. EOC B low during the conversion. The external clock is active and used as the reference at all times. With this mode,  $\overline{WR}$  and  $\overline{RD}$  should not be applied at the rising edge of the clock (see Figure 3).

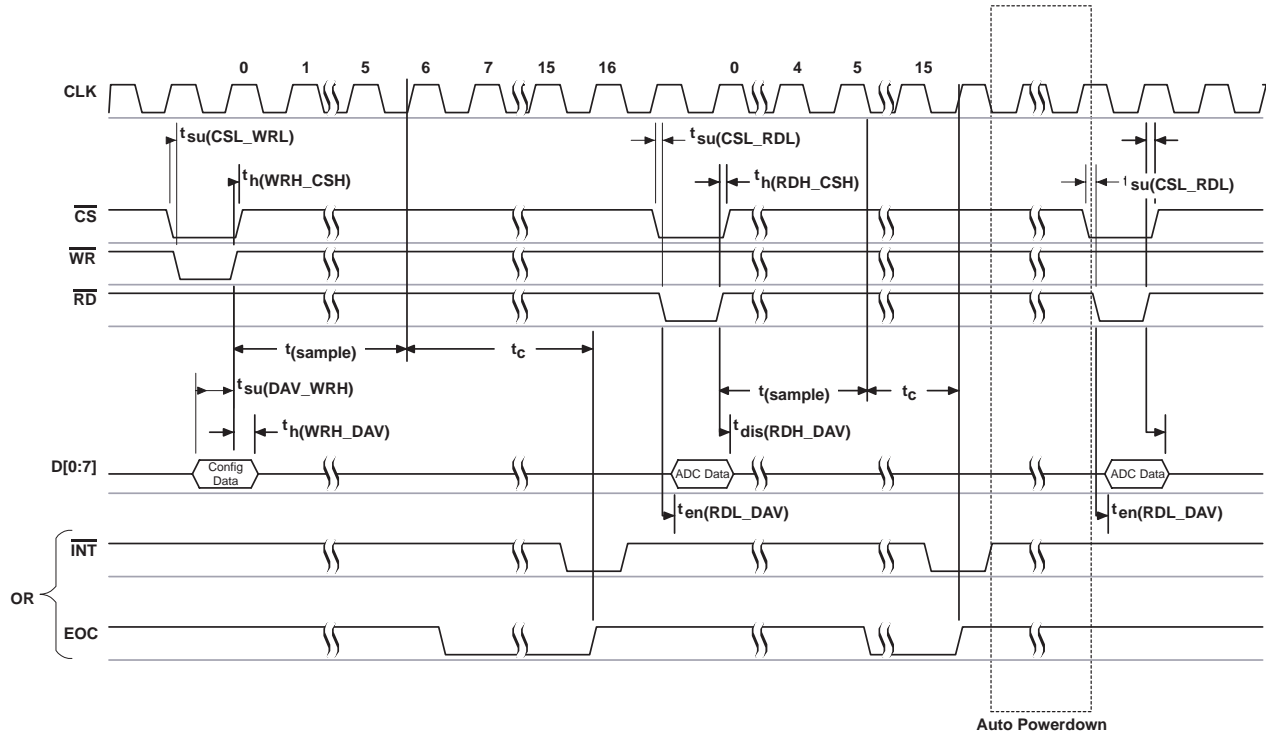

Figure 6. Input Conversion – Software Start, External Clock

# software START conversion (continued)

## internal clock

With  $\overline{CS}$  low and  $\overline{WR}$  low, data is written into the ADC. Sampling begins at the rising edge of  $\overline{WR}$ . Conversion begins 6 clocks after sampling begins. The internal clock begins at the rising edge of  $\overline{WR}$ . The internal clock is disabled after each conversion. Subsequent sampling begins at the rising edge of  $\overline{RD}$ .

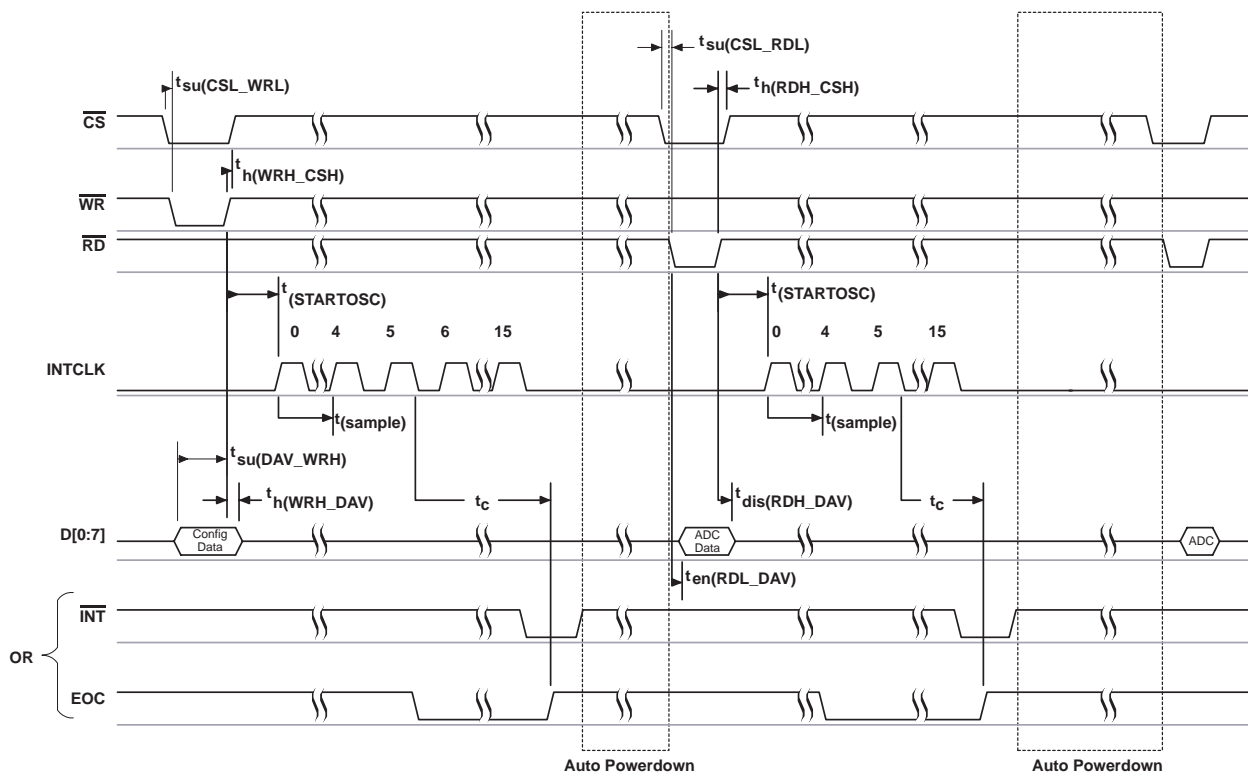

Figure 7. Input Conversion – Software Start, Internal Clock

## TLV571

### 2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT, PARALLEL ANALOG-TO-DIGITAL CONVERTER

SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

#### software START conversion (continued)

##### system clock source

The TLV571 internally derives multiple clocks from the SYSCCLK for different tasks. SYSCCLK is used for most conversion subtasks. The source of SYSCCLK is programmable via control register zero, bit 3. The source of SYSCCLK is changed at the rising edge of  $\overline{WR}$  of the cycle when CR0.D3 is programmed.

##### internal clock (CR0.D3 = 0, SYSCCLK = internal OSC)

The TLV571 has a built-in 10 MHz OSC. When the internal OSC is selected as the source of SYSCCLK, the internal clock starts with a delay (one half of the OSC period max) after the falling edge of the conversion trigger (either  $\overline{WR}$ ,  $\overline{RD}$ , or  $\overline{CSTART}$ ). The OSC speed can be set to  $10 \pm 1$  MHz or  $20 \pm 2$  MHz by setting register bit CR1.D4.

##### external clock (CR0.D3 = 1, SYSCCLK = external clock)

The TLV571 is designed to accept an external clock input (CMOS/TTL logic) with frequencies from 1 MHz to 20 MHz.

##### host processor interface

The TLV571 provides a generic high-speed parallel interface that is compatible with high-performance DSPs and general-purpose microprocessors. The interface includes D(0–7),  $\overline{INT}/EOC$ ,  $\overline{RD}$ , and  $\overline{WR}$ .

##### output format

The data output format is unipolar (code 0 to 255). The output code format can be either binary or twos complement by setting register bit CR1.D1.

##### power up and initialization

After power up,  $\overline{CS}$  must be low to begin an I/O cycle.  $\overline{INT}/EOC$  is initially high. The TLV571 requires two write cycles to configure the two control registers. The first conversion after the device has returned from the power down state may be invalid and should be disregarded.

#### definitions of specifications and terminology

##### integral nonlinearity

Integral nonlinearity refers to the deviation of each individual code from a line drawn from zero through full scale. The point used as zero occurs 1/2 LSB before the first code transition. The full-scale point is defined as level 1/2 LSB beyond the last code transition. The deviation is measured from the center of each particular code to the true straight line between these two points.

##### differential nonlinearity

An ideal ADC exhibits code transitions that are exactly 1 LSB apart. DNL is the deviation from this ideal value. A differential nonlinearity error of less than  $\pm 1$  LSB ensures no missing codes.

##### zero offset

The major carry transition should occur when the analog input is at zero volts. Zero error is defined as the deviation of the actual transition from that point.

##### gain error

The first code transition should occur at an analog value 1/2 LSB above negative full scale. The last transition should occur at an analog value 1 1/2 LSB below the nominal full scale. Gain error is the deviation of the actual difference between first and last code transitions and the ideal difference between first and last code transitions.

**TLV571**  
**2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT,**  
**PARALLEL ANALOG-TO-DIGITAL CONVERTER**  
SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

**software START conversion (continued)**

**signal-to-noise ratio + distortion (SINAD)**

Signal-to-noise ratio + distortion is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

**effective number of bits (ENOB)**

For a sine wave, SINAD can be expressed in terms of the number of bits. Using the following formula,

$$N = (\text{SINAD} - 1.76)/6.02$$

it is possible to get a measure of performance expressed as N, the effective number of bits. Thus, the effective number of bits for a device for sine wave inputs at a given input frequency can be calculated directly from its measured SINAD.

**total harmonic distortion (THD)**

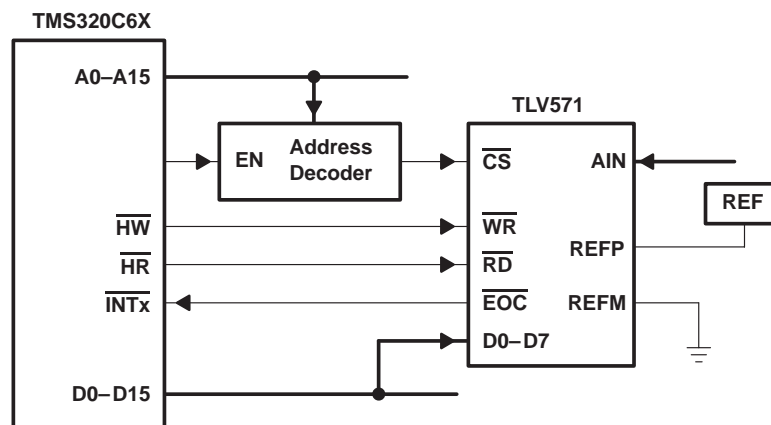

Total harmonic distortion is the ratio of the rms sum of the first six harmonic components to the rms value of the measured input signal and is expressed as a percentage or in decibels.

**spurious free dynamic range (SFDR)**

Spurious free dynamic range is the difference in dB between the rms amplitude of the input signal and the peak spurious signal.

**DSP interface**

The TLV571 is a 8-bit single input channel analog-to-digital converter with throughput up to 1.25 MSPS at 5 V and up to 625 KSPS at 3 V. To achieve 1.25 MSPS throughput, the ADC must be clocked at 20 MHz. Likewise to achieve 625 KSPS throughout, the ADC must be clocked at 10 MHz. The TLV571 can be easily interfaced to microcontrollers, ASICs, and DSPs. Figure 8 shows the pin connections to interface the TLV571 to the TMS320C6x DSP.

**Figure 8. TMS320C6x DSP Interface**

## TLV571

### 2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT, PARALLEL ANALOG-TO-DIGITAL CONVERTER

SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

#### grounding and decoupling considerations

General practices should apply to the PCB design to limit high frequency transients and noise that are fed back into the supply and reference lines. This requires that the supply and reference pins be sufficiently bypassed. In most cases 0.1- $\mu$ F ceramic chip capacitors are adequate to keep the impedance low over a wide frequency range. Since their effectiveness depends largely on the proximity to the individual supply pin, they should be placed as close to the supply pins as possible.

To reduce high frequency and noise coupling, it is highly recommended that digital and analog grounds be shorted immediately outside the package. This can be accomplished by running a low impedance line between DGND and AGND under the package.

Figure 9. Placement for Decoupling Capacitors

#### power supply ground layout

Printed-circuit boards that use separate analog and digital ground planes offer the best system performance. Wire-wrap boards do not perform well and should not be used. The two ground planes should be connected together at the low-impedance power-supply source. The best ground connection may be achieved by connecting the ADC AGND terminal to the system analog ground plane making sure that analog ground currents are well managed.

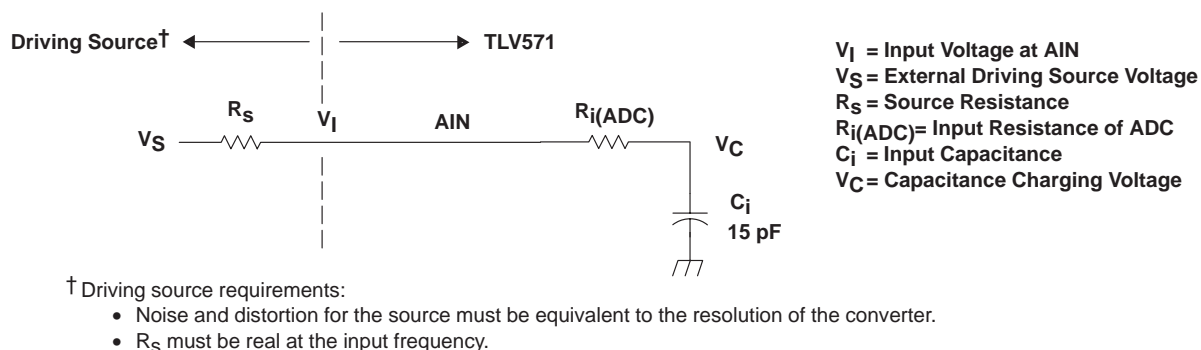

Figure 10. Equivalent Input Circuit Including the Driving Source

**TLV571**  
**2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT,**  
**PARALLEL ANALOG-TO-DIGITAL CONVERTER**  
SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

**simplified analog input analysis**

Using the equivalent circuit in Figure 10, the time required to charge the analog input capacitance from 0 to  $V_S$  within 1/2 LSB,  $t_{ch}(1/2 \text{ LSB})$ , can be derived as follows.

The capacitance charging voltage is given by:

$$V_{C(t)} = V_S \left( 1 - e^{-t_{ch}/R_t C_i} \right)$$

Where

$$R_t = R_s + R_i \quad (1)$$

$$R_i = R_{i(ADC)}$$

$t_{ch}$  = Charge time

The input impedance  $R_i$  is 718  $\Omega$  at 5 V, and is higher ( $\sim 1.25 \text{ k}\Omega$ ) at 2.7 V. The final voltage to 1/2 LSB is given by:

$$V_C (1/2 \text{ LSB}) = V_S - (V_S/512) \quad (2)$$

Equating equation 1 to equation 2 and solving for cycle time  $t_c$  gives:

$$V_S - (V_S/512) = V_S \left( 1 - e^{-t_{ch}/R_t C_i} \right) \quad (3)$$

and time to change to 1/2 LSB (minimum sampling time) is:

$$t_{ch} (1/2 \text{ LSB}) = R_t \times C_i \times \ln(512)$$

Where

$$\ln(512) = 6.238$$

Therefore, with the values given, the time for the analog input signal to settle is:

$$t_{ch} (1/2 \text{ LSB}) = (R_s + 718 \Omega) \times 15 \text{ pF} \times \ln(512) \quad (4)$$

This time must be less than the converter sample time shown in the timing diagrams. Which is 6x SCLK.

$$t_{ch} (1/2 \text{ LSB}) \leq 6 \times 1/f_{(SCLK)} \quad (5)$$

Therefore the maximum SCLK frequency is:

$$\text{Max}(f_{(SCLK)}) = 6/t_{ch} (1/2 \text{ LSB}) = 6/(\ln(512) \times R_t \times C_i) \quad (6)$$

# TLV571

## 2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT, PARALLEL ANALOG-TO-DIGITAL CONVERTER

SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

electrical characteristics over recommended operating free-air temperature range, supply voltages, and reference voltages (unless otherwise noted) (continued)

ac specifications,  $AV_{DD} = DV_{DD} = 5\text{ V}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
Signal-to-noise ratio, SNR	$f_I = 100\text{ kHz}$ , 80% of FS	$f_S = 1.25\text{ MSPS}$ , $AV_{DD} = 5\text{ V}$	47	49		dB	
		$f_S = 625\text{ KSPS}$ , $AV_{DD} = 3\text{ V}$	47	49		dB	
Signal-to-noise ratio + distortion, SINAD	$f_I = 100\text{ kHz}$ , 80% of FS	$f_S = 1.25\text{ MSPS}$ , $AV_{DD} = 5\text{ V}$	47	49		dB	
		$f_S = 625\text{ KSPS}$ , $AV_{DD} = 3\text{ V}$	47	49		dB	
Total harmonic distortion, THD	$f_I = 100\text{ kHz}$ , 80% of FS	$f_S = 1.25\text{ MSPS}$ , $AV_{DD} = 5\text{ V}$		−64	−52	dB	
		$f_S = 625\text{ KSPS}$ , $AV_{DD} = 3\text{ V}$		−62	−52	dB	
Effective number of bits, ENOB	$f_I = 100\text{ kHz}$ , 80% of FS	$f_S = 1.25\text{ MSPS}$ , $AV_{DD} = 5\text{ V}$	7.5	7.9		Bits	
		$f_S = 625\text{ KSPS}$ , $AV_{DD} = 3\text{ V}$	7.5	7.9		Bits	
Spurious free dynamic range, SFDR	$f_I = 100\text{ kHz}$ , 80% of FS	$f_S = 1.25\text{ MSPS}$ , $AV_{DD} = 5\text{ V}$		−65	−51	dB	
		$f_S = 625\text{ KSPS}$ , $AV_{DD} = 3\text{ V}$		−64	−51	dB	
Analog input							
Full-power bandwidth	−1 dB	Full-scale 0 dB input sine wave	12	18		MHz	
	−3 dB	Full-scale 0 dB input sine wave		30		MHz	
Small-signal bandwidth	−1 dB	−20 dB input sine wave	15	20		MHz	
	−3 dB	−20 dB input sine wave		35		MHz	
Sampling rate, $f_S$		$AV_{DD} = 4.5\text{ V to }5.5\text{ V}$	0.0625		1.25	MSPS	
		$AV_{DD} = 2.7\text{ V to }3.3\text{ V}$	0.0625		0.625	MSPS	

## 2.7 V TO 5.5 V, 1-CHANNEL, 8-BIT, PARALLEL ANALOG-TO-DIGITAL CONVERTER

SLAS239A – SEPTEMBER 1999 – REVISED FEBRUARY 2000

**timing requirements,  $AV_{DD} = DV_{DD} = 5\text{ V}$  (unless otherwise noted)**

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_c(\text{CLK})$ Input clock Cycle time	$DV_{DD} = 4.5\text{ V to }5.5\text{ V}$	50			ns
	$DV_{DD} = 2.7\text{ V to }3.3\text{ V}$	100			ns
$t_{\text{(sample)}}$ Reset and sampling time			6		SYCLK Cycles
$t_c$ Total conversion time			10		SYCLK Cycles
$t_{\text{WL(EOC)}}$ Pulse width, end of conversion, EOC			10		SYCLK Cycles
$t_{\text{WL(INT)}}$ Pulse width, interrupt			1		SYCLK Cycles
$t_{\text{(STARTOSC)}}$ Start-up time, internal oscillator		100			ns
$t_{\text{d(CSH\_CSTARTL)}}$ Delay time, $\overline{\text{CS}}$ high to $\overline{\text{CSTART}}$ low			10		ns
$t_{\text{en(RDL\_DAV)}}$ Enable time, data out	$DV_{DD} = 5\text{ V at }50\text{ pF}$		20		ns
	$DV_{DD} = 3\text{ V at }50\text{ pF}$		40		ns
$t_{\text{dis(RDH\_DAV)}}$ Disable time, data out	$DV_{DD} = 5\text{ V at }50\text{ pF}$		5		ns
	$DV_{DD} = 3\text{ V at }50\text{ pF}$		10		ns
$t_{\text{su(CSL\_WRL)}}$ Setup time, $\overline{\text{CS}}$ to $\overline{\text{WR}}$		5			ns
$t_{\text{h(WRH\_CSH)}}$ Hold time, $\overline{\text{CS}}$ to $\overline{\text{WR}}$		5			ns
$t_{\text{w(WR)}}$ Pulse width, write		1			Clock Period
$t_{\text{w(RD)}}$ Pulse width, read		1			Clock Period
$t_{\text{su(DAV\_WRH)}}$ Setup time, data valid to $\overline{\text{WR}}$		10			ns
$t_{\text{h(WRH\_DAV)}}$ Hold time, data valid to $\overline{\text{WR}}$		5			ns
$t_{\text{su(CSL\_RDL)}}$ Setup time, $\overline{\text{CS}}$ to $\overline{\text{RD}}$			5		ns
$t_{\text{h(RDH\_CSH)}}$ Hold time, $\overline{\text{CS}}$ to $\overline{\text{RD}}$			5		ns
$t_{\text{h(WRL\_EXTCLKH)}}$ Hold time $\overline{\text{WR}}$ to clock high		5			ns
$t_{\text{h(RDL\_EXTCLKH)}}$ Hold time $\overline{\text{RD}}$ to clock high		5			ns
$t_{\text{h(CSTARTL\_EXTCLKH)}}$ Hold time $\overline{\text{CSTART}}$ to clock high		5			ns
$t_{\text{su(WRH\_EXTCLKH)}}$ Setup time $\overline{\text{WR}}$ high to clock high		5			ns
$t_{\text{su(RDH\_EXTCLKH)}}$ Setup time $\overline{\text{RD}}$ high to clock high		5			ns
$t_{\text{su(CSTARTH\_EXTCLKH)}}$ Setup time $\overline{\text{CSTART}}$ high to clock high		5			ns
$t_{\text{d(EXTCLK\_CSTARTL)}}$ Delay time clock low to $\overline{\text{CSTART}}$ low		5			ns

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TLV571IDW	ACTIVE	SOIC	DW	24	25	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 85	TLV571I	<a href="#">Samples</a>
TLV571IDWG4	ACTIVE	SOIC	DW	24	25	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM	-40 to 85	TLV571I	<a href="#">Samples</a>
TLV571IPW	ACTIVE	TSSOP	PW	24	60	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TY571	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## MECHANICAL DATA

DW (R-PDSO-G24)

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in inches (millimeters). Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - Body dimensions do not include mold flash or protrusion not to exceed 0.006 (0,15).
  - Falls within JEDEC MS-013 variation AD.

## MECHANICAL DATA

PW (R-PDSO-G24)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

## LAND PATTERN DATA

### PW (R-PDSO-G24)

### PLASTIC SMALL OUTLINE

#### NOTES:

- All linear dimensions are in millimeters.
- This drawing is subject to change without notice.
- Publication IPC-7351 is recommended for alternate design.
- Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
- Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
