description

The TLC5921 is a current-sink constant current driver incorporating shift register and data latch. The current value at constant current output can be set by one external register. The device also incorporates thermal shutdown (TSD) circuitry which turns constant current output off when the junction temperature exceeds the limit, and LED open detection (LOD) circuitry to report the LED was disconnected.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
SIN	5	I	1 bit serial data input
SOUT	28	O	1 bit serial data output
SCLK	4	I	Clock input for data transfer. All the data in the shift register is shifted to MSB by 1 bit synchronizing to the rising edge of SCLK, and data at SIN is shifted to LSB at the same time. (Schmitt buffer input)
XLAT	3	I	Latch. When XLAT is high, data on shift register goes through latch. When XLAT is low, data is latched. Accordingly, if data on shift register is changed during XLAT high, this new value is latched (level latch). This terminal is internally pulled down with 100kΩ.
SOMODE	30	I	Timing select for serial data output. When SOMODE is low, output data on SOUT is changed synchronizing to the rising edge of SCLK. When SOMODE is high, output data on SOUT is changed synchronizing to the falling edge of SCLK.
OUT0 – OUT15	7,8,10,11,12,13, 15,16,17,18,20, 21,22,23,25,26	O	Constant current output.
BLANK	2	I	Blank(Light off). When BLANK is high, all the output of constant current driver is turned off. When BLANK is low and data written to latch is 1, the corresponding constant current output turns on (LED on). This terminal is internally pulled up with 100kΩ.
IREF	31	I	Constant current value setting. LED current is set to desired value by connecting external resistor between IREF and GND. The 38 times current compared to current across external resistor sink on output terminal.
XDOWN	29	O	Error output. XDOWN is configured as open collector. It goes low when TSD or LOD functions.
VCC	32		Power supply voltage
GND	1		Ground
PGND	6,9,14,19,24,27		Ground for LED driver. (Internally connected to GND)
THERMAL PAD	package bottom		Heat sink pad. This pad is connected to the lowest potential to IC or thermal layer.

absolute maximum ratings (see Note 1)†

Supply voltage, V_{CC}	– 0.3 V to 7 V
Output current (dc), $I_{O(LC)}$	90 mA
Input voltage range, V_I	– 0.3 V to $V_{CC} + 0.3$ V
Output voltage range, $V_{O(SOUT)}$, $V_{O(XDOWN)}$	– 0.3 V to $V_{CC} + 0.3$ V
Output voltage range, $V_{O(OUTn)}$	– 0.3 V to 18 V
Storage temperature range, T_{stg}	–40°C to 150°C
Continuous total power dissipation at (or below) $T_A = 25^\circ\text{C}$	3.9 W
Power dissipation rating at (or above) $T_A = 25^\circ\text{C}$	31.4 mW/°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to GND terminal.

TLC5921 LED DRIVER

SLLS390 – SEPTEMBER 1999

PRINCIPLES OF OPERATION

setting for constant output current value

The constant current value is determined by external resistor, $R_{(IREF)}$ between IREF and GND. Refer constant output current characteristics shown on Figure 5 for this external resistor value.

Note that more current flows if connect IREF to GND directly.

constant output current operation

When BLANK is low, the corresponding output is turned on if data latch value is 1, and turned off if data latch value is 0. When BLANK is high, all outputs are forced to turn off. If there is constant current output terminal left unconnected (includes LED disconnection), it should be lighted on after writing zero to corresponding data latch to its output. If this operation is not done, supply current through constant current driver will increase.

shift register latch

The shift register latch is configured with 16×1 bits. The 1 bit for constant current output data represents ON for constant current output if data is 1, or OFF if data is 0. The configuration of shift register latch is shown in below.

Figure 3. Relationship Between Shift Register and Latch

SOUT output timing selection

By setting level of SOMODE, the SOUT output timing can be changed. When SOMODE is set to low, data is clocked out to SOUT synchronized on the rising edge of SCLK, and when SOMODE is set to high, data is clocked out to SOUT synchronized on the falling edge of SCLK. When SOMODE is set to high and shift operation is done, the data shift error can be prevented even though SCLK signal is externally buffered in serial. Note that the maximum data transfer rate in cascade operation is slower than that when SMODE is set to low.

TSD (thermal shutdown)

When the junction temperature exceeds the limit, TSD starts to function and turn constant current output off and XDOWN goes low. Since XDOWN is configured with open-collector output, the outputs of multiple ICs can be concatenated. To recover from constant current output off-state to normal operation, power supply should be turned off and then turned on after several seconds.

PRINCIPLES OF OPERATION

LOD function (LED open detection)

If any terminal voltage of constant current output (OUT0 TO 15) to be turned on is approximately below 0.3 V, XDOWN output goes low during output on by knowing LED disconnection. This function is operational for sixteen OUTn individually. To know which constant current output is disconnected, the level of XDOWN is repeatedly checked 16 times from OUT0 to OUT15 turning one constant current output on. The power supply voltage for LED should be set to that the constant current output is applied to above 0.4 V to prevent from XDOWN low when LED is lighting on normally. Note that on-time should be minimum 1 μ s after the constant current output is turned on since XDOWN output is required approximately 1 μ s.

As discussed earlier, XDOWN is used for both TSD and LOD function. Therefore, BLANK is used to know which one of TSD or LOD worked when XDOWN went low at LED disconnection, that is, in this condition, when set BLANK to high, all the constant current outputs are turned off and LOD disconnection detection is disabled, then, if XDOWN was changed to high, LED disconnection must be occurred.

Table 1 is an example for XDOWN output status using four LEDs.

Table 1. XDOWN Output Example

LED NUMBER	1	2	3	4
LED STATUS	GOOD	NG	GOOD	NG
OUTn	ON	ON	ON	ON
DETECTION RESULT	GOOD	NG	GOOD	NG
XDOWN	LOW (by case 2, 4)			
LED NUMBER	1	2	3	4
LED STATUS	GOOD	NG	GOOD	NG
OUTn	ON	ON	OFF	OFF
DETECTION RESULT	GOOD	NG	GOOD	GOOD
XDOWN	LOW (by case 2)			
LED NUMBER	1	2	3	4
LED STATUS	GOOD	NG	GOOD	NG
OUTn	OFF	OFF	OFF	OFF
DETECTION RESULT	GOOD	GOOD	GOOD	GOOD
XDOWN2	HIGH-IMPEDANCE			

noise reduction : output slope

When output current is 80 mA, the time to change constant current output to turn-on and turn-off is approximately 150 ns and 250 ns respectively. This allows to reduce concurrent switching noise occurred when multiple outputs turn or off at the same time.

thermal pad

The thermal pad should be connected to GND to eliminate the noise influence since it is connected to the bottom side of IC chip. Also, desired thermal effect will be obtained by connecting this pad to the PCB pattern with better thermal conductivity.

TLC5921
LED DRIVER

SLLS390 – SEPTEMBER 1999

PRINCIPLES OF OPERATION

power rating – free-air temperature

- NOTES: A. The data is based on simulation result. When TI recommended print circuit board is used, derate linearly at the rate of 31.4 mW/°C for operation above 25°C free-air temperature. VCC=5 V, IO(LC) = 80 mA, ICC is typical value.
- B. The thermal impedance will be varied depend on mounting conditions. Since PZP package established low thermal impedance by radiating heat from thermal pad, the thermal pad should be soldered to pattern with low thermal impedance.
- C. The material for PCB should be selected considering the thermal characteristics since the temperature will rise around the thermal pad.

Figure 4. Power Rating

PRINCIPLES OF OPERATION

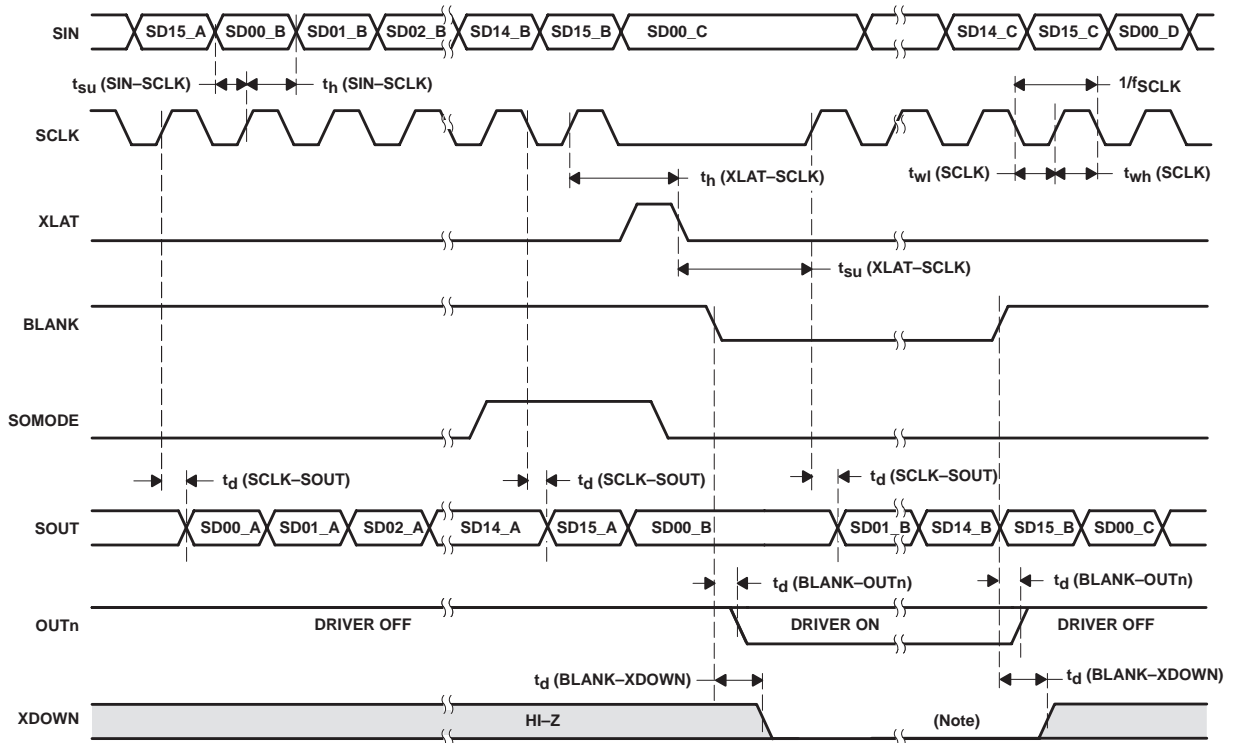

constant output current

Conditions : $V_O = 1\text{ V}$, $V_{Ref} = 1.3\text{ V}$

NOTE: The resistor, $R_{(IREF)}$, should be located as close to IREF terminal as possible to avoid the noise influence.

Figure 5. Current on Constant Current Output vs External Resistor

NOTE : LED disconnected

Figure 6. Timing Diagram

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

THERMAL PAD MECHANICAL DATA

DAP (R-PDSO-G32)

PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206319-3/M 09/13

NOTE: All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
