## QUINT-PS-100-240AC/24DC/5

## Single-Phase Primary-Switched Power Supply Unit

#### **INTERFACE**

**Data Sheet** 

© PHOENIX CONTACT - 12/2005

## **Description**

QUINT POWER devices are 60...960 W DC power supply units for universal use. This is ensured by the wide-range input, single and three-phase versions, and an international approval package.

QUINT POWER stands for guaranteed supply: powerful capacitors ensure mains buffering of more than 20 ms at full load.

All three-phase devices provide the full output power, even in the event of a continuous phase failure.

The POWER BOOST power reserve starts loads with high inrush currents and ensures that fuses are reliably tripped.

Preventive function monitoring diagnoses impermissible operating states and minimizes downtimes in your system. An active transistor output and a floating relay contact are used for remote monitoring.

All QUINT POWER devices are idling-proof and short-circuit proof, and are available with a regulated and adjustable output voltage of 12, 24, and 48 V DC with output currents of 2.5, 5, 10, 20, 30, and 40 A.

Power supply units for use in Ex Zone 2, uninterruptible solutions, AS-i power supply units, and a QUINT diode complete the product range.

QUINT POWER is a built-in device. Installation and startup must only be carried out by qualified personnel. The relevant country-specific regulations (e.g., VDE, DIN) must also be observed.

#### Danger

The device contains dangerous live elements and high levels of stored energy. Never carry out work when the power is turned on.

## Risk of burns

The housing temperature can reach high values depending on the ambient temperature and the load of the device.

Make sure you always use the latest documentation.

It can be downloaded at www.download.phoenixcontact.com.

A conversion table is available on the Internet at

(EN 55022)<sup>4</sup>

Industrial and domestic applications

- <sup>1</sup> EN 61000 corresponds to IEC 61000
- <sup>2</sup> Criterion B: Temporary adverse effects on the operating behavior, which the device corrects automatically.
- <sup>3</sup> Criterion A: Normal operating behavior within the specified limits.
- <sup>4</sup> EN 55011 corresponds to CISPR11/EN 55022 corresponds to CISPR22

#### **Structure**

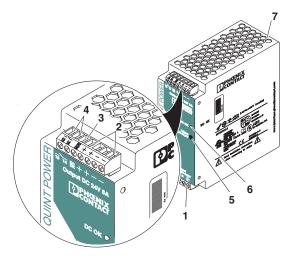

Figure 1 Operating elements

- 1 AC input 85...264 V AC input voltage, 45...65 Hz frequency
- 2 DC output 24 V DC output voltage (default), can be set between 22.5 and 28.5 V DC
- 3 DC OK output active
- 4 DC OK output floating
- 5 Potentiometer (covered) 22.5...28.5 V DC
- 6 DC OK LED
- 7 Universal DIN rail adapter UTA 107

## **Block Diagram**

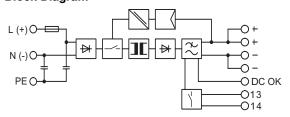

Figure 2 Block diagram

## **Safety Notes and Warning Instructions**

#### **Danger**

The device contains dangerous live elements and high levels of stored energy.

Never carry out work when the power is turned on.

#### Risk of burns

The housing temperature can reach high values depending on the ambient temperature and the load of the device.

To ensure that the device can be operated safely and all functions can be used, please read these instructions carefully.

QUINT POWER is a built-in device. Installation and startup must only be carried out by qualified personnel. The relevant country-specific regulations (e.g., VDE, DIN) must also be observed.

#### Before startup please ensure:

- The mains has been connected correctly and protection is provided against electric shock.
- The device can be switched off outside the power supply according to EN 60950 regulations (e.g., by the line protection on the primary side).
- The protective conductor is connected.
- All supply lines have sufficient fuse protection and are the correct size.
- All output cables are the correct size for the maximum device output current or have separate fuse protection.
- Sufficient convection is ensured.

### Installation

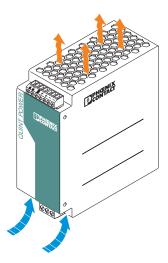

Figure 3 Convection

## Risk of burns

The housing temperature can reach high values depending on the ambient temperature and the load of the device.

To ensure sufficient convection, the following minimum spacing is required between other modules:

5 cm above and below the device.

No minimum spacing to other modules at the sides is required for proper operation of the device.

The power supply unit can be snapped onto all DIN rails according to EN 60715 and must be mounted horizontally (connection terminal blocks facing downwards).

## **Mounting Position**

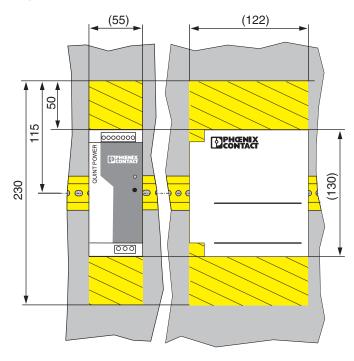

Figure 4 Mounting position (dimensions in mm)

Narrow mounting position: Installation depth 125 mm (+ DIN rail)

## **Narrow Mounting Position (Default Upon Delivery)**

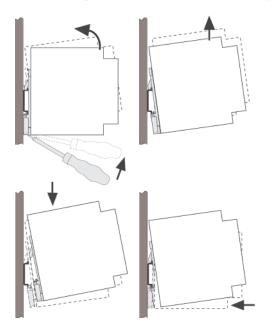

Figure 5 Narrow mounting position

Flat mounting position: Installation depth 58 mm (+ DIN rail)

## **Assembly**

Position the module with the DIN rail guideway on the top edge of the DIN rail and then snap it downwards.

#### Removal

Release the snap-on catch using a screwdriver and then detach the module from the bottom edge of the DIN rail.

Datasheet of 2938581 - AC/DC CONVERTER 24V 14W

Contact us: sales@integrated-circuit.com Website: www.integrated-circuit.com

#### QUINT-PS-100-240AC/24DC/5

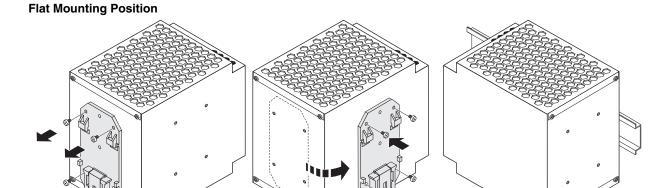

Figure 6 Flat mounting position

A flat mounting position can be achieved by mounting the module onto the DIN rail at a 90° angle. Mount the DIN rail adapter (UTA 107) as shown in Figure 6.

No additional assembly material is required. Mounting screws: Torx T10 (torque 0.8...0.9 Nm).

## Connection of Various Types of Network: 100...240 V AC Networks

The device can be connected to single-phase AC networks or to two external conductors for three-phase networks (TN, TT or IT network according to VDE 0100-300/ IEC 60364-3) with nominal voltages of 100...240 V AC.

An all-pole disconnecting device must be provided for 2-phase operation using two external conductors for a three-phase network.

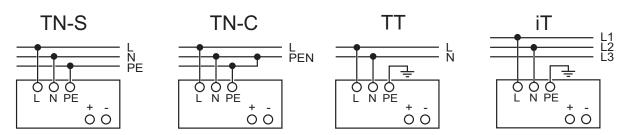

Figure 7 100...240 V AC networks

Datasheet of 2938581 - AC/DC CONVERTER 24V 14W

Contact us: sales@integrated-circuit.com Website: www.integrated-circuit.com

#### QUINT-PS-100-240AC/24DC/5

## **Connection of the Connecting Cable**

The device is equipped with COMBICON connectors. This connection method enables quick device connection and visible isolation of the electrical connection, if required.

Connectors may only be operated when the power is switched off.

Use a screwdriver with the correct blade width for wiring. The cable cross sections listed in the table on the right can be connected.

|        | Solid  | Stranded | AWG  | Torque | Stripping<br>Length |
|--------|--------|----------|------|--------|---------------------|
|        | [m     | m²]      |      | [Nm]   | [mm]                |
| Input  | 0.22.5 | 0.22.5   | 2514 | 0.50.6 | 7 mm                |
| Output | 0.22.5 | 0.22.5   | 2514 | 0.50.6 | 7 mm                |
| Signal | 0.22.5 | 0.22.5   | 2514 | 0.50.6 | 7 mm                |

For reliable and safe-to-touch connections, strip the cable ends according to the table.

## Input (1)

The 100...240 V AC connection is made using the L, N, and  $\ \oplus$  screw connections.

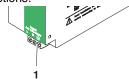

Figure 8 Input

#### **Fuses**

An **internal fuse** is provided for device protection. Additional device protection is not required.

If an internal fuse is blown, this is most probably due to a device fault. In this case, the device should be checked in the factory.

#### **Recommended Backup Fuse**

Circuit breaker 6 A, 10 A or 16 A, Characteristic B (or equivalent).

A suitable fuse should be provided for DC applications.

#### **Protecting the Primary Side**

The device must be installed according to the specifications of EN 60950.

It must be possible to switch off the device using a suitable disconnecting device outside the power supply.

For example, primary side line protection could be used.

## Output

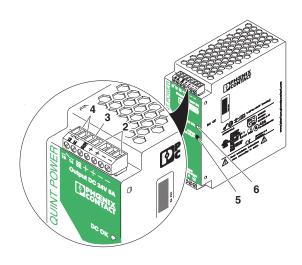

Figure 9 Output

#### **Connecting the Output**

The connection is made using the "+" and "-" screw connections on the screw connection ②. The output voltage set upon delivery is 24 V DC. The output voltage can be set on the potentiometer ⑤.

#### **Protecting the Secondary Side**

The device is electronically short-circuit-proof and idling-proof. In the event of an error, the output voltage is limited to a maximum of 35 V DC.

Make sure that all output cables are the correct size for the maximum output current or have separate fuse protection.

The cable cross sections in the secondary circuit must be large enough to keep the voltage drops on the cables as low as possible.

#### Signaling

The two DC OK outputs are for preventive function monitoring of the power supply unit. A floating signal contact ④ and an active DC OK signal ③ are available. In addition, the DC OK LED ⑥ can be used to evaluate the function of the power supply directly at the installation location (see "Status Indicator: DC OK LED" on page 10).

#### **Floating Contact**

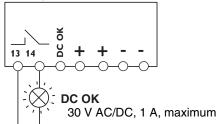

Figure 10 Floating contact

When opened, the floating signal contact indicates that the output voltage has fallen more than 10% below the set value. Signals and ohmic loads up to a maximum of 30 V and currents up to a maximum of 1 A can be switched.

With heavy inductive loads, e.g., a relay, a suitable protective circuit (e.g., free-wheeling diode) is required.

## **Active Signal Output**

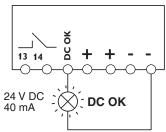

Figure 11 Active signal output

The 24 V DC signal is between the "DC OK" and "-" connection terminal blocks and can be loaded with 40 mA maximum. This signal output indicates that the output voltage has fallen more than 10% below the set value when "active high" changes to "low". The DC OK signal is isolated from the power output. This ensures that a separate supply does not enter from devices connected in parallel. The 24 V DC signal can be connected directly to a logic input for evaluation.

#### Signal Loop

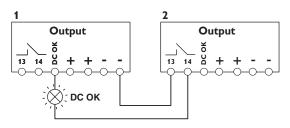

Figure 12 Signal loop

Status Indicator: DC OK LED

The green DC OK LED enables local function evaluation in the control cabinet.

The two signal outputs described above can be easily combined.

**Example:** Monitoring two devices

Use the active alarm output of device 1 and loop in the floating alarm output of device 2. In the event of an error, a group error message is output. Any number of devices can be looped. This signal combination saves wiring costs and logic inputs.

| DC OK LED                     | ON   | Flashing  | OFF  |
|-------------------------------|--|---|--|
| Active DC OK switching output | U = +24 V (with reference to "-")                  | U = 0 V (with reference to "-")                 | U = 0 V (with reference to "-")  |
| Floating DC OK output         | Closed   | Open  | Open   |
| Cause                         | Output voltage greater than 90% of the set voltage | Output voltage less than 90% of the set voltage | No voltage at the output   |
| Meaning                       | Output voltage and current OK                      | QUINT POWER operating, but:                     | QUINT POWER not operating, because:  - No mains voltage present  - The primary side fuse has blown  - The device is faulty |

## **Function**

## **Output Characteristic Curve**

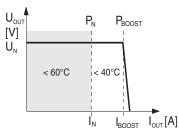

Figure 13 Output characteristic curve

At ambient operating temperatures  $T_{amb} < +40^{\circ} C$ , the device can continuously supply an  $I_{BOOST}$  current at nominal voltage. In the event of heavier loads the working point demonstrates the U/I characteristic curve shown in the figure. The output current is limited to  $I_{BOOST}$ . The secondary voltage is reduced until the short circuit on the secondary side is removed.

The U/I characteristic curve ensures that both heavy capacitive loads and loads with DC/DC converters can be supplied by QUINT POWER in the input circuit. Connected fuses are tripped. The selectivity in your system configuration is ensured at all times.

$$U_N = +24 V$$

$$I_N = 5 A$$

$$- I_{BOOST} = 7.5 A$$

$$- P_N = 120 W$$

P<sub>BOOST</sub> = 180 W

#### **Temperature Response**

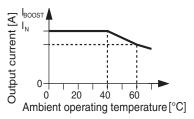

Figure 14 Temperature response

At an ambient operating temperature of up to +40 °C, the device continuously supplies the  $I_{BOOST}$  output current.

The device can supply a nominal output current of  $I_N$  up to an ambient operating temperature of +60°C. The output power must be decreased by 2.5% per Kelvin temperature increase for ambient operating temperatures over +60°C.

At ambient operating temperatures above +70°C or in the event of a thermal overload, the device does not switch off. The output power is decreased to such an extent that device protection is provided. Once the device has cooled down, the output power is increased again.

## **Parallel Operation**

Devices of the same type can be connected in parallel to increase both redundancy and power. The default setting does not have to be adjusted.

A maximum of five devices can be connected in parallel.

If the output voltage is adjusted, an even current distribution can be ensured by precisely setting all power supply units that are operated in parallel to the same output voltage.

To ensure symmetrical current distribution we recommend that all cable connections from the power supply unit to the DIN rail are the same length and have the same cross section.

Depending on the system, for parallel connection of more than two power supply units a protective circuit should be installed at each individual device output (e.g., decoupling diode or DC fuse). This prevents high return currents in the event of a secondary device fault.

#### **Redundancy Operation**

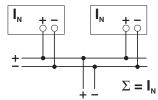

Figure 15 Redundancy operation

Redundant circuits are suitable for supplying systems, which place particularly high demands on operational safety.

If a fault occurs in the primary circuit of the first power supply unit, the second device automatically takes over the entire power supply, without interruption, and vice versa.

For this purpose, the power supply units to be connected in parallel must be large enough that the total current requirements of all loads can be fully met by one power supply unit.

External decoupling diodes are required for 100% redundancy (QUINT-DIODE/40, Order No. 29 38 96 3).

#### **Increasing Power**

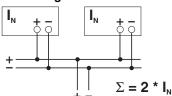

Figure 16 Increasing power

The output current can be increased to  $\mathbf{n} \times \mathbf{I}_N$  where  $\mathbf{n}$  is the number of devices connected in parallel.

Parallel connection for increasing power is used when extending existing systems. A parallel connection is recommended if the power supply unit does not cover the current consumption of the most powerful load.

Otherwise, the loads should be divided over independent individual devices.

A maximum of five devices can be connected in parallel.
