#### DESCRIPTION

TURBOSWITCH, family, drastically cuts losses in both the diode and the associated switching IGBT or MOSFET in all "freewheel mode" operations and is particularly suitable and efficient in motor control freewheel applications and in booster

diode applications in power factor control circuitries.

Packaged in TO-220AC, isolated TO-220AC and D<sup>2</sup>PAK, these 600V devices are particularly intended for use on 240V domestic mains.

**APPLICATION DATA**

The TURBOSWITCH is especially designed to provide the lowest overall power losses in any "FREEWHEEL Mode" application (Fig.A) considering both the diode and the companion

transistor, thus optimizing the overall performance in the end application. The way of calculating the power losses is given below:

**Fig. A : "FREEWHEEL" MODE**

**STTA1206D/DI/G**

**APPLICATION DATA (Cont'd)**

**Fig. B: STATIC CHARACTERISTICS**

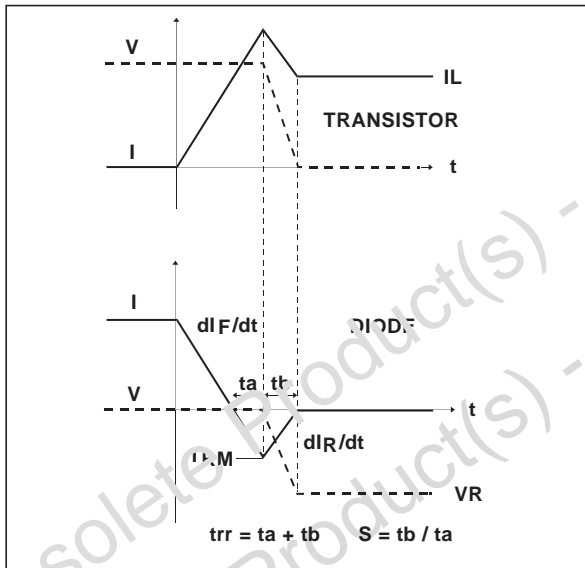

**Conduction losses :**

$$P1 = V_{t0} \cdot I_F(AV) + R_d \cdot I_F^2(RMS)$$

**Reverse losses :**

$$P2 = V_R \cdot I_R \cdot (1 - \delta)$$

**Fig. C: TURN-OFF CHARACTERISTICS**

**Turn-on losses :**

(in the transistor, due to the diode)

$$P5 = \frac{V_R \times I_{RM}^2 \times (3 + 2 \times S) \times F}{6 \times di_F / dt} + \frac{V_R \times I_{RM} \times I_L \times (S + 2) \times F}{2 \times di_F / dt}$$

**Turn-off losses (in the diode) :**

$$P3 = \frac{V_R \times I_{RM}^2 \times S \times F}{6 \times di_F / dt}$$

P3 and P5 are suitable for power MOSFET and IGBT

**Fig. D: TURN-ON CHARACTERISTICS**

**Turn-on losses :**

$$P4 = 0.4 (V_{FP} - V_F) \cdot I_{Fmax} \cdot t_{fr} \cdot F$$
